## Supplementary information for

# Development of a method for trace level determination of antibiotics in drinking water sources by high performance liquid chromatography-tandem mass spectrometry

### Tables

Table S1 Target antibiotics and their properties.

Table S2 Signal suppression of target antibiotics in the drinking water sources after extraction (antibiotics concentration, 50  $\mu\text{g L}^{-1}$ ).

### Figures

Figure S1 A total ion chromatogram reflecting the effect of organic mobile phase (mobile phase B) on chromatographic separation.

Figure S2 A total ion chromatogram reflecting the effect of formic acid concentration on chromatographic separation.

Figure S3 A total ion chromatogram reflecting the effect of flow rate on chromatographic separation.

Figure S4 A total ion chromatogram reflecting the effect of injection volume on chromatographic separation.

1 The signal suppression (or enhancement) for each antibiotic was calculated by  
2 the following equation:

$$\frac{A_{sp} - A_{non-sp}}{A_{sd}} - 1$$

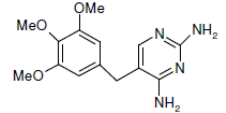

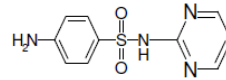

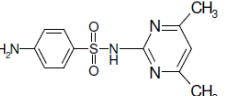

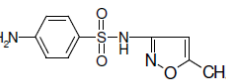

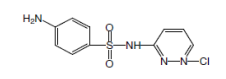

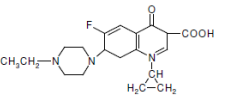

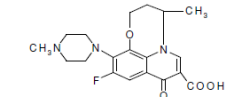

3  
4 (1)

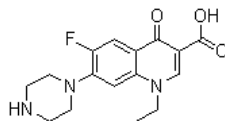

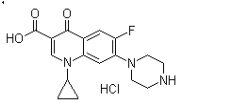

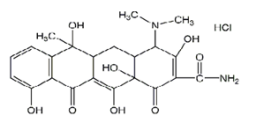

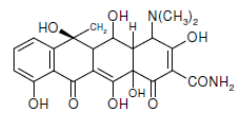

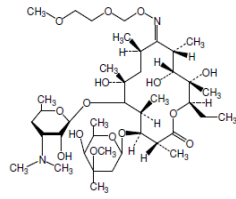

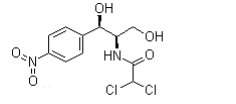

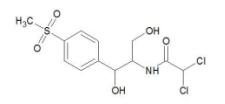

5 Where,  $A_{sp}$  is the peak area in drinking water sources extract spiked after extraction  
6 with  $50 \mu\text{g L}^{-1}$  of each antibiotic;  $A_{non-sp}$  is the peak area in drinking water sources  
7 extract non-spiked after extraction;  $A_{sd}$  is the peak area of the antibiotic standard  
8 mixture of  $50 \mu\text{g L}^{-1}$ .

9 A value of  $< 1$  indicates signal suppression, and a value of  $> 1$  indicates signal  
10 enhancement.
