**General experimental:** All reactions were carried out in air. Carboxylic acids, *N*-Chlorosuccinimide (NCS), base, and the solvent used in this reaction were obtained from commercial sources and used without further purification. Flash column chromatography was performed using silica gel (300-400 mesh). Analytical thin-layer chromatography was performed using glass plates pre-coated with 200-300 mesh silica gel impregnated with a fluorescent indicator (254 nm). NMR spectra were recorded in CDCl<sub>3</sub> on a Varian Inova-400 NMR spectrometer (400 MHz); chemical shifts were reported in ppm with the solvent signals as reference, and coupling constants (J) were given in Hertz. The peak information was described as: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, comp = composite. Products were characterized by comparison of <sup>1</sup>H NMR, <sup>13</sup>C NMR and TOF-MS data in the literatures.

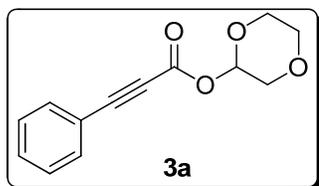

#### **General Procedure for the NCS-Promoted Oxidative Coupling Esterfication.**

To a Schlenk tube equipped with a magnetic stir bar was added carboxylic acids (**1**, 0.30 mmol), NCS (*N*-Chlorosuccinimide, 68.1 mg, 0.51 mmol), base (0.51 mmol), and ether **2** (2.0 mL). The reaction mixture was stirred at 80 °C for 12 hours. At the end of the reaction, the reaction mixture was cooled to room temperature. After removal of the solvent, the residue was purified by column chromatography on silica gel (eluent: hexanes:EtOAc = 6:1) to afford the pure products.
