1. General information

All glassware was thoroughly oven-dried. Chemicals and solvents were either purchased from commercial suppliers or purified by standard techniques. Thin-layer chromatography (TLC) plates were visualized by exposure to ultraviolet light and/or staining with phosphomolybdic acid followed by heating on a hot plate. Flash chromatography was carried out using silica gel (200-300 mesh). ^1H NMR and ^{13}C NMR spectra were recorded on a Bruker AM-400 (400 MHz). The spectra were recorded in CDCl_3 as solvent at room temperature, ^1H and ^{13}C NMR chemical shifts are reported in ppm relative to the residual solvent peak. The residual solvent signals were used as references and the chemical shifts were converted to the TMS scale (CDCl_3 : $\delta_{\text{H}} = 7.26$ ppm, $\delta_{\text{C}} = 77.00$ ppm). Data for ^1H NMR are reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet, comp = complex), integration, coupling constant (Hz) and assignment. Data for ^{13}C NMR are reported as chemical shift. IR spectra were recorded using Nicolet NEXUS 670 FT-IR instrument and are reported in wavenumbers (cm^{-1}). HRMS were performed on a Bruker Apex II mass instrument (ESI).

2. General procedure for the synthesis of substrates

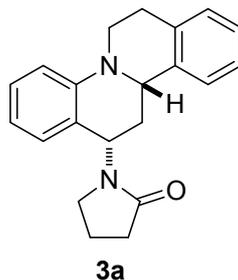

All substrates were either commercially available and used without further purification or were prepared according to literature procedures^{1,2}

3. General procedure for the synthesis of product 3 and analytical data

A mixture of tetrahydroisoquinoline **1** (0.2 mmol), [Ru(bpy)₃]Cl₂·6H₂O (1.5 mg, 1 mol%) and acetonitrile (2 mL) was degassed by three cycles of freeze-pump-thaw. BrCCl₃ (59.1 μL, 0.6 mmol, 3.0 equiv.) was added and the mixture was stirred under an inert atmosphere at room temperature while irradiated by blue LEDs (at a distance of approximately 5 cm so that the reaction mixture did not heat up during the reaction). Full conversion of the tetrahydroisoquinoline was ensured by TLC. Then, to the reaction mixture was added Electron-donating alkene **2** (1 mmol, 5.0 equiv.) and Cs₂CO₃ (78.2 mg, 0.24 mmol, 1.2 equiv.), then the reaction system was evacuated and refilled with argon three times. The reaction mixture was stirred overnight (16 h) in dark under an inert atmosphere at room temperature. After completion of the reaction, the crude mixture was purified by flash chromatography (silica gel, mixtures of petroleum/ethyl acetate) to afford the pure product **3**.

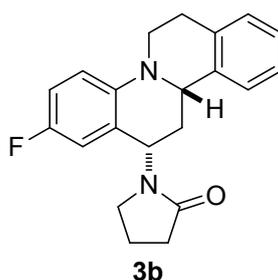

13-cis-1-(7,11b,12,13-tetrahydro-6H-isoquinolino[2,1-a]quinolin-13-yl)pyrrolidin-2-one (3a)

Following the general procedure, compound **3a** was obtained as a white solid in 86% yield (>20:1 d.r.); mp=175-178°C; R_f =0.27 (petroleum/ethyl acetate 1:1 v/v);
