Oxoiron(IV)-mediated Baeyer-Villiger oxidation of cyclohexanones generated by dioxygen
with co-oxidation of aldehydes.

Materials

Analytical and physical measurements

Determination of products

Catalytic oxidations

Stoichiometric oxidations

I. Iron-catalyzed Baeyer-Villiger oxidation of cyclohexanones with O₂ in the presence of aldehydes

II. Fe^{IV}=O formation with O₂ in the presence of aldehydes

III. Fe^{IV}=O mediated Baeyer-Villiger oxidation

Materials

[Fe^{II}(N₄Py)(CH₃CN)](ClO₄)₂ was prepared according to the literature. All other chemicals were commercial products and they were used without further purification.

Analytical and physical measurements

UV-vis spectra were recorded on an Agilent 8453 diode-array spectrophotometer using quartz cells. GC analyses were performed on an Agilent 7820A gas chromatograph equipped with a flame ionization detector and a 30 m HP-5 column. GC-MS analyses were carried out on Shimadzu QP2010SE equipped with a secondary electron multiplier detector with conversion dynode and a 30 m HP-5MS column.

Determination of products

All reactions were carried out in a 20 mL Schlenk tube equipped with a condenser. Cyclohexanone (1.00×10^{-2} M), $[\text{Fe}^{\text{II}}(\text{N}_4\text{Py})(\text{CH}_3\text{CN})](\text{ClO}_4)_2$ (1.00×10^{-5} M), acetonitrile (5 mL) and the initiator isobutyraldehyde or benzaldehyde derivatives (1.50×10^{-1} M) were added and then the mixture was stirred at 25°C or 60°C under oxygen atmosphere for 2-24 hours. The products were identified by GC (Agilent 7820A) and GC-MS (Shimadzu QP2010SE) and the yields were calculated based on the amount of cyclohexanone consumed in the reactions.

Catalytic oxidations

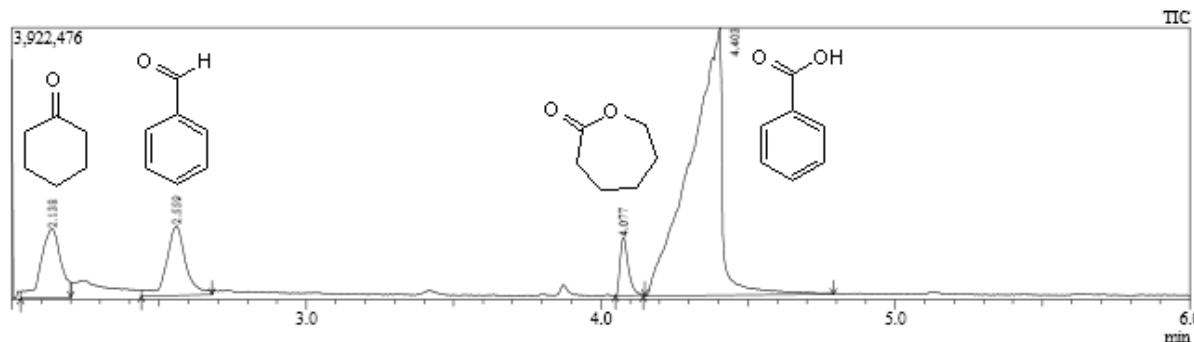

$[\text{Fe}^{\text{II}}(\text{N}_4\text{Py})(\text{CH}_3\text{CN})](\text{ClO}_4)_2$ complex (2.00×10^{-3} M) was dissolved in acetonitrile (1.5 mL) then the benzaldehyde was added to the solution and the progress of the reaction was monitored with UV-vis spectrophotometer (Agilent 8453) at 693 nm ($\varepsilon = 400 \text{ M}^{-1} \text{ cm}^{-1}$).

Stoichiometric oxidations

$[\text{Fe}^{\text{II}}(\text{N}_4\text{Py})(\text{CH}_3\text{CN})](\text{ClO}_4)_2$ complex (2.00×10^{-3} M) was dissolved in acetonitrile (1.5 mL), then iodosobenzene (4.00×10^{-3} M) was added to the solution. The mixture was stirred for one hour then excess iodosobenzene was removed by filtration. Cyclohexanone (1.00×10^{-1} M) was added to the solution and the reaction was monitored with UV-vis spectrophotometer (Agilent 8453) at 693 nm ($\varepsilon = 400 \text{ M}^{-1} \text{ cm}^{-1}$).

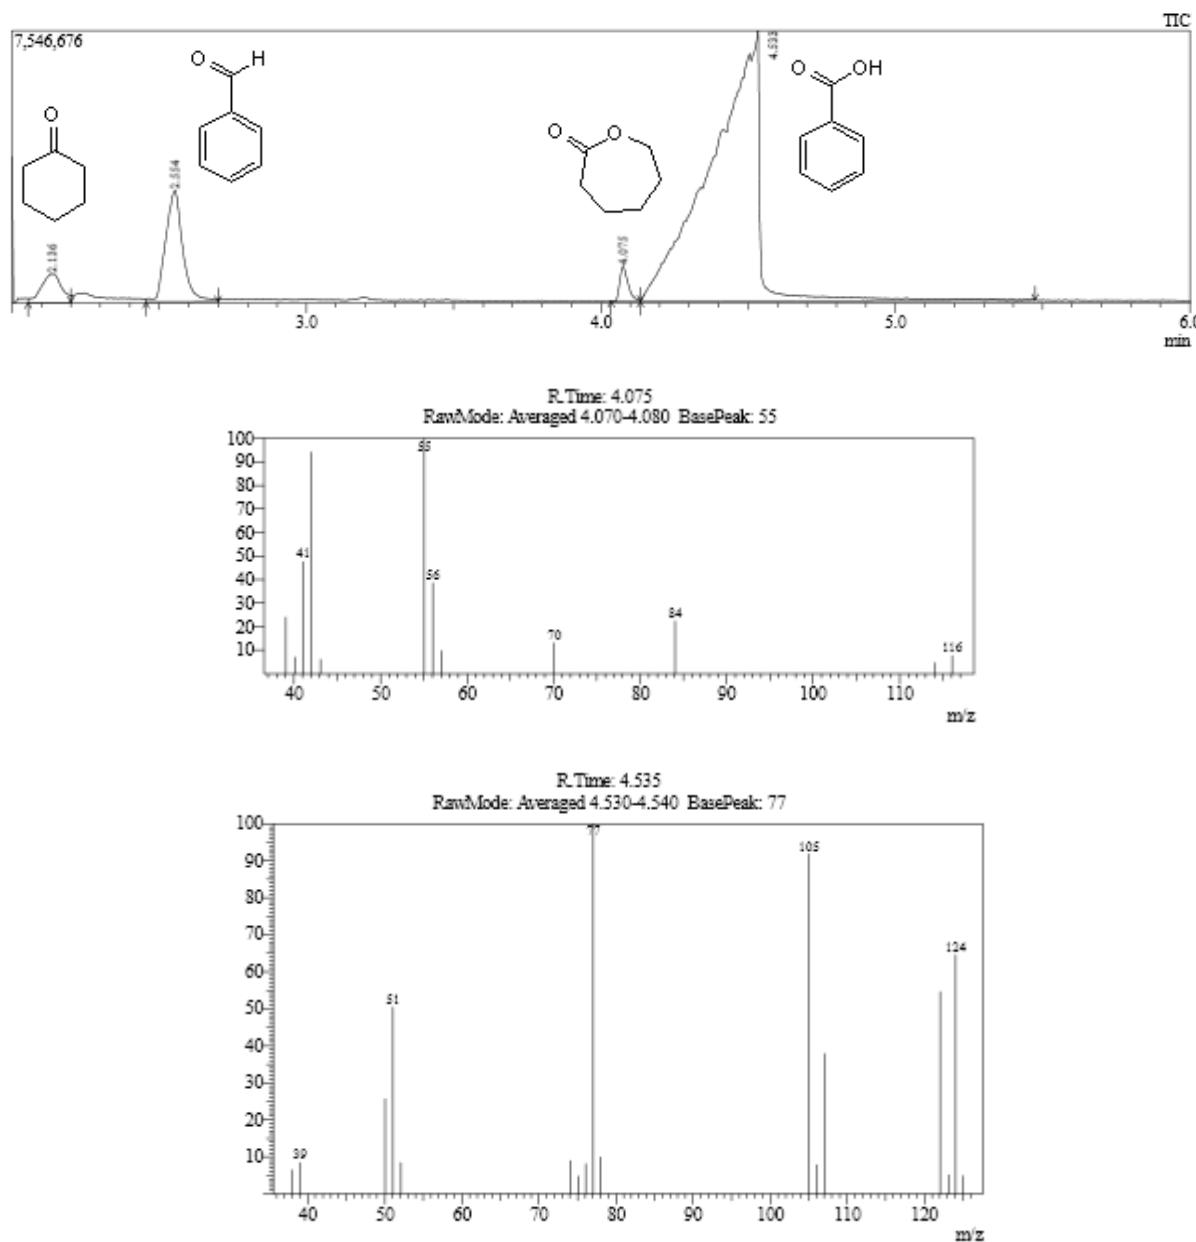

I. Iron-catalyzed Baeyer-Villiger oxidation of cyclohexanones with O₂ in the presence of aldehydes

Fig. S1. GC-MS chromatogram of the reaction of cyclohexanone, benzaldehyde and **1** in MeCN at 60°C under oxygen atmosphere. $[\mathbf{1}]_0 = 1.00 \times 10^{-5}$ M, $[\text{cyclohexanone}]_0 = 1.00 \times 10^{-2}$ M, $[\text{benzaldehyde}]_0 = 1.50 \times 10^{-1}$ M.
