## A. General method

All reactions were performed for synthesis of products **3a-3u** at 80 °C in a round bottom flask equipped with oxygen bag and magnetic stir bar. NMR spectra were recorded using a Bruker Avance 400 MHz NMR spectrometer (100 M Hz for carbon) and respectively referenced to 7.26 and 77.0 ppm for chloroform-d solvent with TMS as internal standard. ESI-MS spectra were measured on Finnigan Mat TSQ 7000 instruments. Elemental analyses were performed on a Heraeus elemental analyzer. Melting points were measured with a Tektronix X4 apparatus and are uncorrected. TLC was performed using commercially prepared 100-400 mesh silica gel plates (GF<sub>254</sub>), and visualization was effected at 254 nm.

## B. General procedure

**Synthesis of 3a:** 2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one **1a** (80 mg, 0.5 mmol), *n*-butyl acrylate **2a** (128 mg, 1 mmol), Pd(OAc)<sub>2</sub> (11.2 mg, 10 mol%) and PivOH (255 mg, 2.5 mmol) were stirred in 1 mL of DMF equipped with oxygen bag at 80 °C for 24 h. After completion of the reaction (monitored by TLC), the water (10 mL) was added. The aqueous solution was extracted with ethyl acetate (3×10 mL) and the combined extract was dried with anhydrous MgSO<sub>4</sub>. The solvent was removed and the crude product was separated by column chromatography (eluted with petroleum ether/ethyl acetate = 2:1) to give a pure sample of **3a** (105 mg, 74% yield).
