### Indium/Fe(III) - mediated regioselective $\beta$ -cross-coupling aldol type addition reaction of activated alkenes to isatins/isatinimines in aqueous media

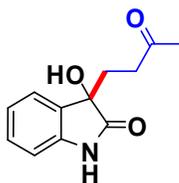

A. Sanjeeva Kumar<sup>a</sup>, Palakuri Ramesh<sup>a</sup>, G. Santosh Kumar<sup>a</sup>, Jagadeesh Babu Nanubolu<sup>b</sup>, T. Prabhakar Rao<sup>c</sup> and H. M. Meshram<sup>a\*</sup>

**General procedure for the synthesis of compounds 4 or 5:** A mixture of isatin/isatinimine **1/2** (1 mmol),  $\alpha,\beta$ -unsaturated carbonyl compound **2** (1.5 mmol) in 5 mL THF:H<sub>2</sub>O (9:1) was added the Indium metal (2 mmol), FeCl<sub>3</sub> (5 mol%) and was stirred at rt for 5-30 min. The progress of the reaction was monitored by TLC. After the completion of the reaction, the reaction mixture was filtered off and the solvent was removed under vacuum. The residue obtained was then purified by silica gel column chromatography (60–120 mesh) using ethyl acetate/hexane as eluent to get corresponding products. All the obtained products **4** or **5** were characterized by <sup>1</sup>H NMR, <sup>13</sup>C NMR, Mass and IR spectral data.

### Crystallographic data for **4I**

X-ray data for the compound were collected at room temperature using a Bruker Smart Apex CCD diffractometer with graphite monochromated MoK $\alpha$  radiation ( $\lambda=0.71073\text{\AA}$ ) with  $\omega$ -scan method.<sup>1</sup> Preliminary lattice parameters and orientation matrices were obtained from four sets of frames. Unit cell dimensions were determined using 3385 reflections. Integration and scaling of intensity data were accomplished using SAINT program.<sup>1</sup> The structures were solved by Direct Methods using SHELXS97<sup>2</sup> and refinement was carried out by full-matrix least-squares technique using SHELXL97.<sup>2</sup> Anisotropic displacement parameters were included for all non-hydrogen atoms. All H atoms were positioned geometrically and treated as riding on their parent C atoms, with C-H distances of 0.93--0.97  $\text{\AA}$ , and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}$  for methyl atoms.

**Figure 1:** ORTEP diagram of the single crystal X-ray structure of the compound **4I** with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms are shown as small spheres of arbitrary radius. There are two molecules in the asymmetric unit which are connected by N-H $\cdots$ O and O-H $\cdots$ O hydrogen bonds (shown as dotted lines).
