## **Computational methods**

It is generally recognized that MPWB1K and BB1K methods give good results for barrier height calculations thermochemistry and thermochemical kinetics.<sup>1,2</sup> In addition, these energy barriers involved in the title reactions are calculated to be about 1-5 kcal/mol at the MPWB1K/6-31+G(d,p) level. Therefore, the geometric parameters of the stationary points are optimized at the BB1K/6-31+G(d,p) level. The potential barriers  $\Delta E$  (kcal mol<sup>-1</sup>) and reaction heats  $\Delta H$  (kcal mol<sup>-1</sup>) are presented in **Fig. S1**. In addition, the rate constants of the initial steps are calculated at 298 K and 1 atm and are listed in **Table S2**. The computational results indicate that the total rate constant based on the MPWB1K method matches well with the experimental value whereas that based on the BB1K method are nearly over 1 order of magnitude lower than that

of the literature. Obviously, the MPWB1K method is suitable for thermochemistry and thermochemical kinetics of this work.

### The reliability of the tunneling corrections in RRKM method

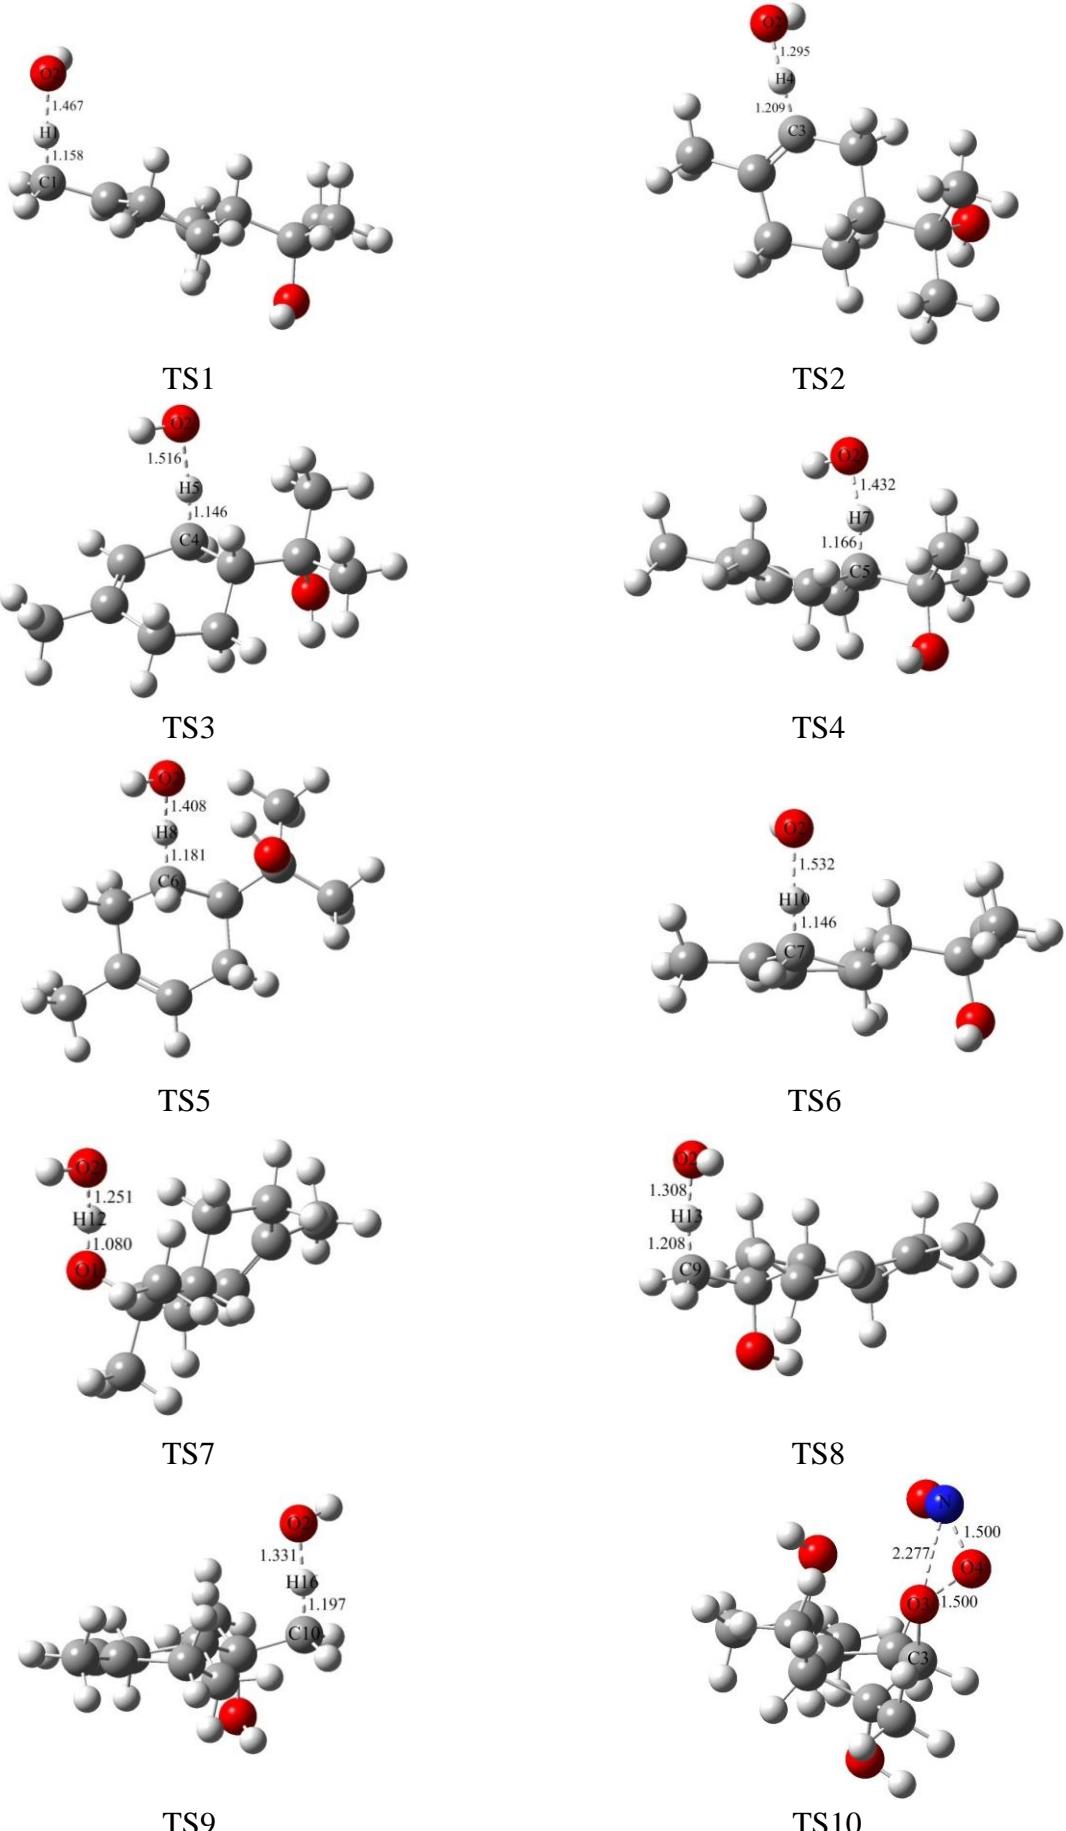

The CVT with SCT correction is a reliable method to calculate the rate constants including tunneling effect. In order to verify the reliability of the tunneling corrections in the RRKM method, the rate constants of the initial H-abstraction steps are also calculated employing the CVT/SCT method over a suitable range of 180-380 K. The computed data are fitted in the Arrhenius formula  $k=A \exp(-E_a/RT)$ . **Table S3** lists the reaction rates at 298 K and the corresponding Arrhenius equation. Comparison shows that the rates in **Table 1** and **Table S3** have the good consistence. Therefore, the RRKM method for tunneling correction in this work is effective.
