General Remarks: The ^1H and ^{13}C NMR spectra were recorded on a Varian Mercury-Plus 300 or Varian INOVA 400 NMR instrument. All melting points are uncorrected. CH_2Cl_2 , CH_3CN , DMF, and Et_3N were distilled from CaH_2 , and THF was freshly distilled from Na prior to use. All other reagents were obtained from commercial sources and were used without further purification. Column other chromatography was performed on 200–300 mesh silica gel. Thin-layer chromatography was conducted on Kieselgel60 F254.

General procedure for the synthesis of amides 3a-3r:

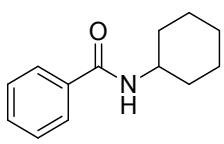

A solution of $\text{P}(\text{OEt})_3$ (1.0 mmol) in CH_2Cl_2 (5 mL) was added successively I_2 (1.0 mmol), **1** (1.0 mmol) and tertiary amine (Et_3N or N-methylmorpholine, 1.5 mmol) at 0 °C and then stirred at room temperature for 30 minutes. After addition of amine **2** (1.2 mmol) directly or the solution of amine's hydrochloride salt in DMF with one euqivalent of tertiary amine to the mixture, the reaction mixture was stirred for 2–12 hours indicated in Table 2 and then diluted with CH_2Cl_2 (60 mL), washed with aqueous NH_4Cl , 5% NaOH and brine, dried (Na_2SO_4), and evaporated in vacuo. The residue was pure enough for the spectroscopic analysis, or purified by flash column chromatography on silica gel using hexane/EtOAc (12:1–4:1) as eluent, or recrystallize with ether to give the corresponding products **3a-3r**.
