## Surface energies

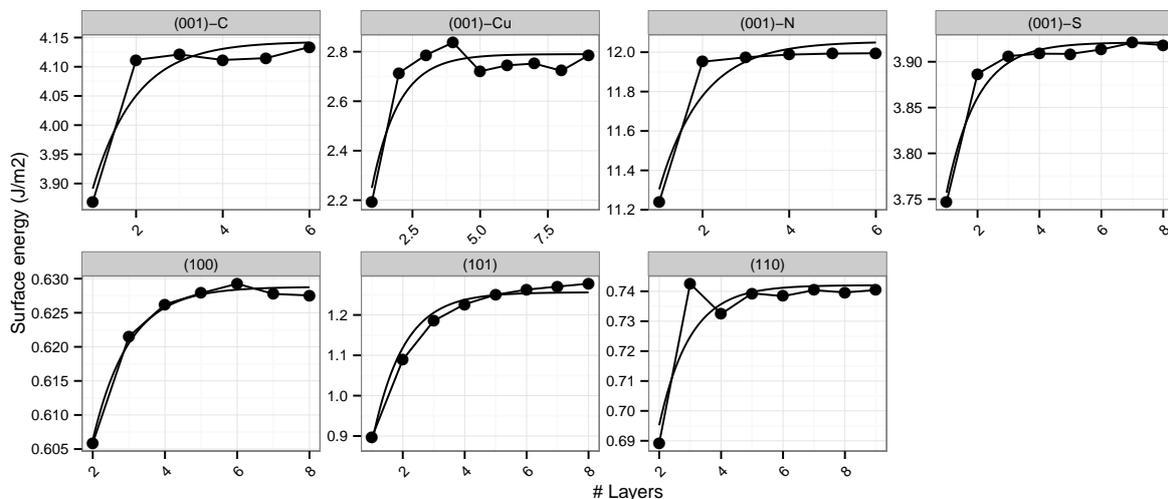

Figure S-1: Convergence of surface energies ( $\text{J}/\text{m}^2$ ) with the number of layers.

## Comparison of contour plots

The adsorption energies for each combination of anchor and surface are standardized as  $(x - \mu)/\sigma$  for a fair scale of comparison. The tables below show the pairwise distances computed for the matrix where the rows correspond to the four monodentate anchors and the columns to each x-y observation on the screening grid. The distance between each anchor is computed as the Euclidean distance,  $d = \sqrt{\sum (x_i + y_i)^2}$ .
