General Information

NMR spectra were recorded on a 300 MHz instrument using CDCl_3 as solvent unless and otherwise stated (*s* = singlet, *d* = doublet, *t* = triplet, *m* = multiplet). The ^1H and ^{13}C chemical shifts are reported in parts per million relative to tetramethylsilane as an internal standard. For the Mass spectrometry, ion source temperature was 150–250°C, as required. High-resolution EI-mass spectra were performed with a resolution of 10,000. For chromatography, analytical TLC plates and 70–230 mesh silica gel were used. All the solvents and chemicals were purchased and used as available.

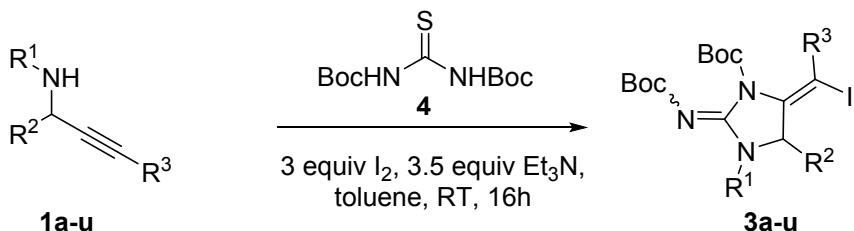

The microwave irradiation experiments were carried out in a dedicated CEM-Discover monomode microwave apparatus, operating at a frequency of 2.45 GHz with continuous irradiation power from 0 to 300 W and utilization of the standard absorbance level of 100 W. The reactions were carried out in 10 mL glass tubes, sealed with Teflon septum and placed in the microwave cavity. The reactions were irradiated at the required set temperature for the stipulated time and then cooled to ambient temperature with air jet cooling.

Experimental procedure

a) Synthesis of starting material

All propargylamines **1a–u** were synthesized according to the literature^[S1]

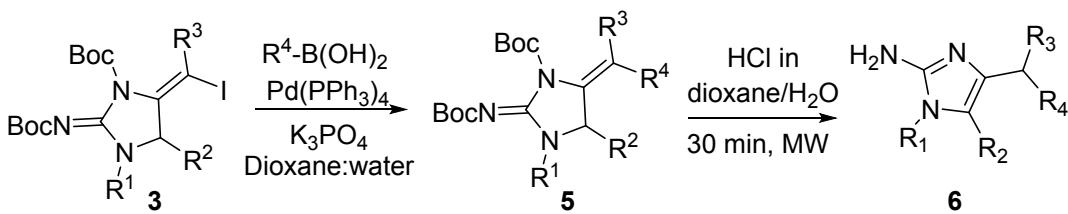

b) One-pot guanylation/iodocyclization procedure

Propargylamine **1a–u** (1 mmol) was dissolved in toluene (10 mL) followed by addition of N,N-diBoc-thiourea (427 mg, 1.5 mmol) and triethylamine (0.488 mL, 3.5 mmol). The mixture was flushed with nitrogen and cooled down to 0°C when iodine (761 mg, 3 mmol) was slowly added and the mixture was allowed to warm up to room temperature and stirred for 16 h. Thereafter the reaction was quenched by the addition of sodium bisulfite (aq. sat. solution 20 mL). The organic layer was separated, dissolved with diethyl ether (100 mL) and washed with water (3 x 50 mL). The solvent was evaporated by reduced pressure. The product was purified by column chromatography (heptane/ethyl acetate 10:1.5).

c) Suzuki/deprotection reaction procedure

A mixture of the iodocyclized product (0.162 mmol), boronic acid (0.259 mmol), Pd(PPh₃)₄ (11.23 mg, 9.72 µmol) and potassium phosphate (68.7 mg, 0.324 mmol) in dioxane/water (9:1, 1 mL) was degassed and flushed with nitrogen and then allowed to stir at 85°C for 24 h. The reaction mixture was dissolved with water (10 mL) and extracted with ethyl acetate (3 x 30 mL). The organic phase was concentrated *in vacuo* and purified by preparative HPLC (MeCN/H₂O 50% to 100% in 20 min followed by 100% MeCN for 10 min). The purified product was concentrated, dissolved in dioxane and flushed with nitrogen followed by dropwise addition of hydrochloric acid (4N) in water/dioxane solution (50 equiv, 2 mL). The reaction vial was submitted to microwave irradiation for 30 min at 70°C and 150 W followed by concentration under reduced pressure to provide **6**.

To the reaction mixture was added water (10 mL) and it was extracted with ethyl acetate (3 x 30 mL). The organic phase was concentrated *in vacuo* and purified by preparative HPLC (MeCN/H₂O 50% to 100% in 20 min followed by 100% MeCN for 10 min) to afford **7** (74.7 mg, 0.134 mmol, 83% yield).
