Figure Captions

Fig. S1. The pH profile in SBR through all the stages. The pH of initial aeration represented the pH value in each SBR cycle when the feeding was finished and aeration initiated.

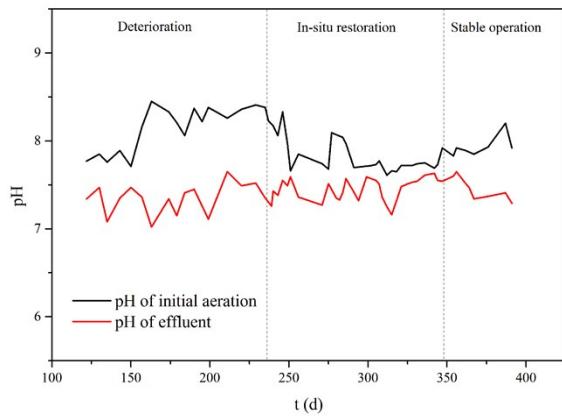

Fig. S2. The evolution of activities of AOB, NOB and anammox and the nitrite accumulation rate during the stages of deterioration, in-situ restoration and recovered stable operation.

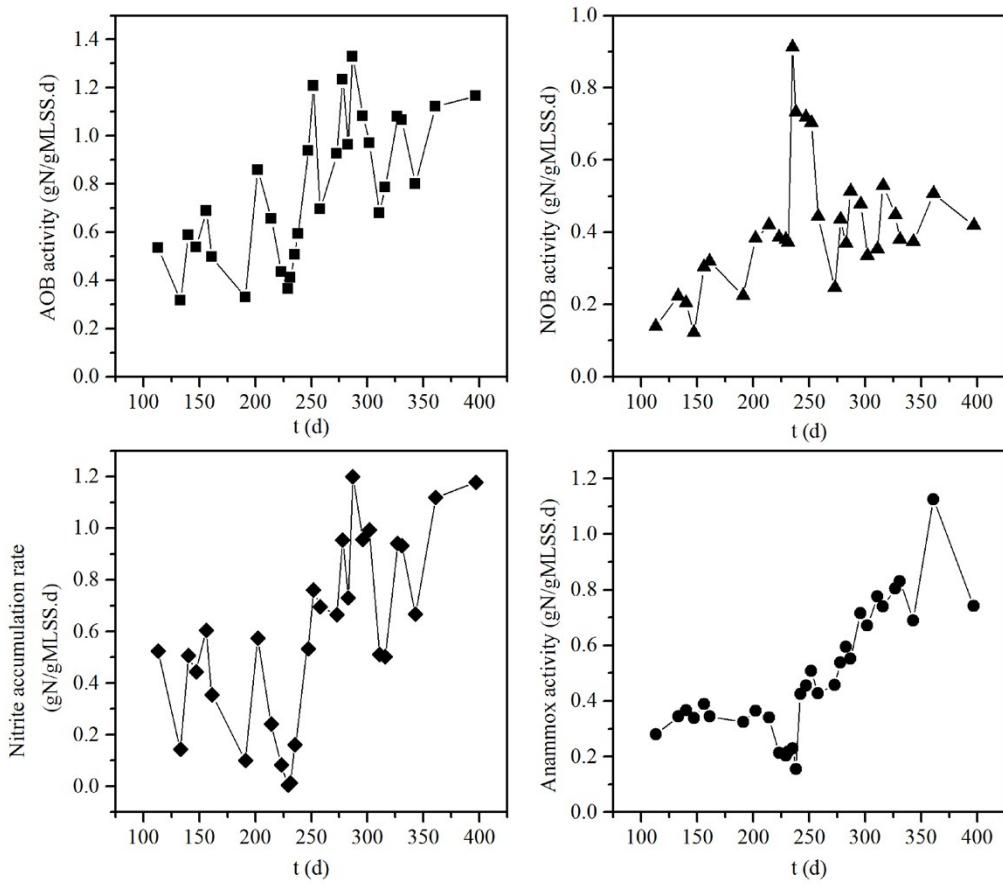

Fig. S3. The simulation of the recovery of NRR by the modified Boltzmann model. The initial of the horizontal axis was corresponding to the start point of the in-situ restoration.

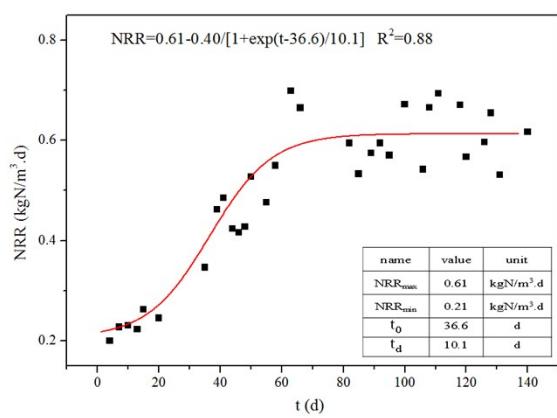

Fig. S4. The fitting curve of the *nxrA* gene abundance during the in-situ restoration and the recovered stable operation. The initial of the horizontal axis was corresponding to the day 230 with the maximum *nxrA* abundance in the whole operation of CPNA process. The vertical axis represented the gene copy concentration (copies gMLSS⁻¹).

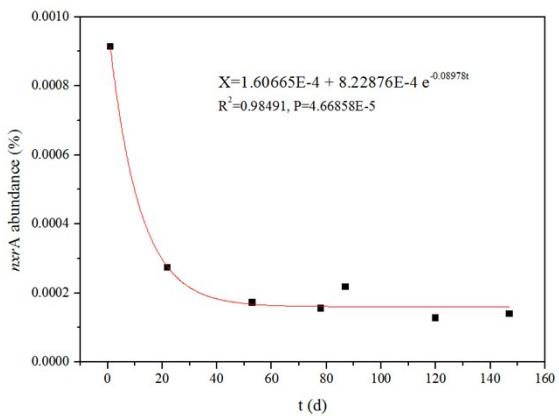

Fig. S5. The fitting curves of the exponential growth of the functional genes during the second in-situ restoration stage with NH₂OH dosing and SRT control and the recovered stable operation. The initial of the horizontal axis was corresponding to the start point of the second stage of in-situ restoration. The vertical axis represented the gene copy concentration (copies gMLSS⁻¹).

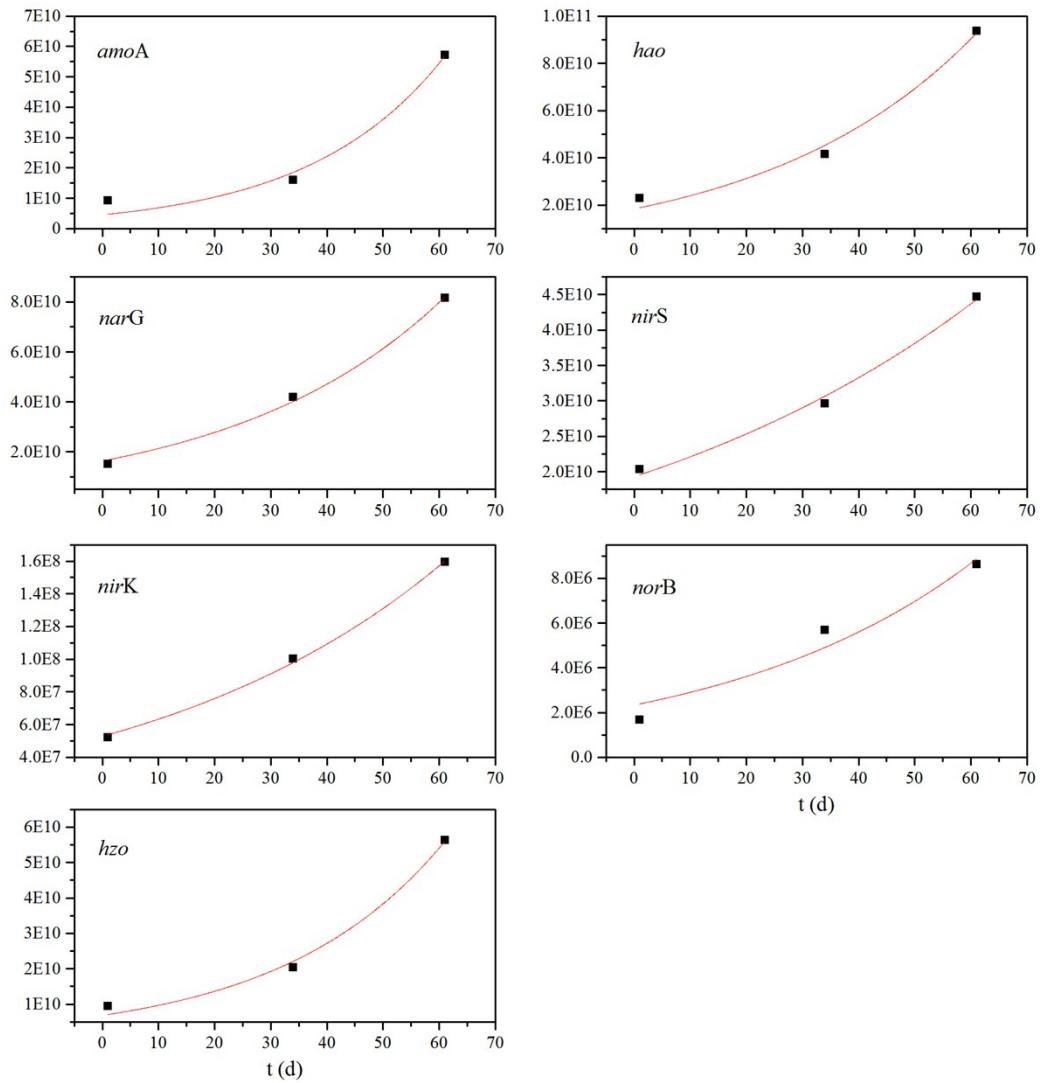

Fig. S6. Rarefaction curves for each sample.

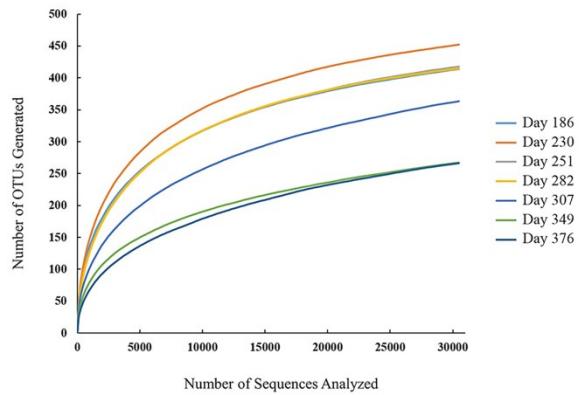

Fig. S7. Evolution of microbial community at phylum level.

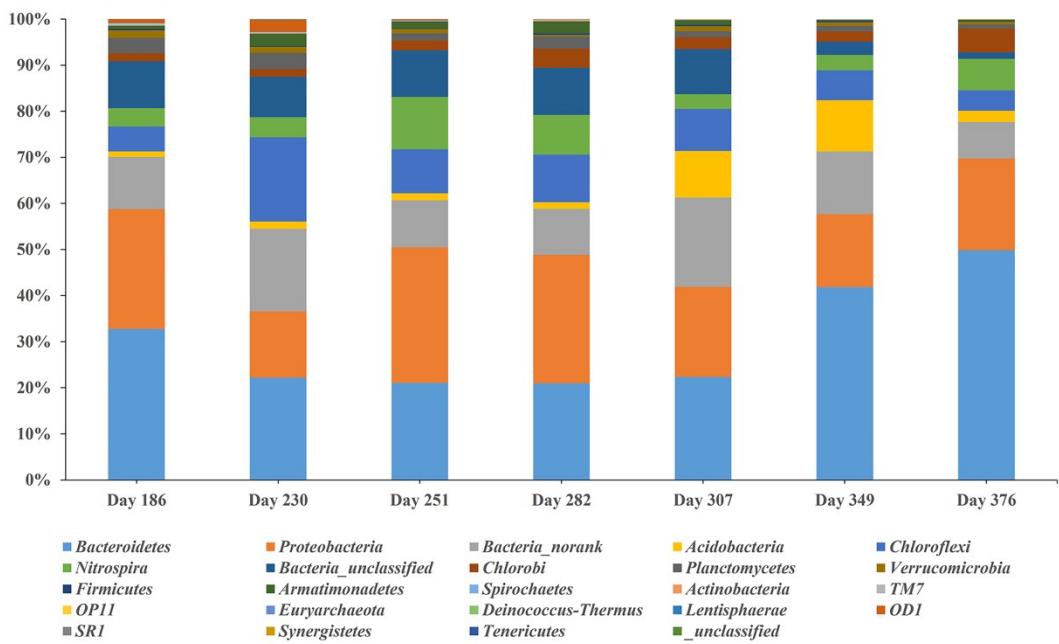

Table S1 The primers sequences, expected amplicon size, and annealing temperature for each target gene used in this study.

Target genes	Primer	Sequences (5'-3')	Amplicon size(bp)	Annealing temp. (°C)	Reference
