### S1. Calculation procedures of selectivity from IAST

The measured experimental data is excess loadings ( $q^{ex}$ ) of the pure components C<sub>2</sub>H<sub>2</sub>, CO<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>6</sub> and C<sub>3</sub>H<sub>8</sub> for **JLU-Liu33F**, which should be converted to absolute loadings ( $q$ ) firstly.

$$q = q^{ex} + \frac{pV_{pore}}{ZRT}$$

Here Z is the compressibility factor. The Peng-Robinson equation was used to estimate the value of compressibility factor to obtain the absolute loading, while the measure pore volume 0.36 cm<sup>3</sup> g<sup>-1</sup> is also necessary.

The dual-site Langmuir-Freundlich equation is used for fitting the isotherm data at 298 K.

$$q = q_{m1} \times \frac{b_1 \times p^{1/n_1}}{1 + b_1 \times p^{1/n_1}} + q_{m2} \times \frac{b_2 \times p^{1/n_2}}{1 + b_2 \times p^{1/n_2}}$$

Here p is the pressure of the bulk gas at equilibrium with the adsorbed phase (kPa), q is the adsorbed amount per mass of adsorbent (mol kg<sup>-1</sup>),  $q_{m1}$  and  $q_{m2}$  are the saturation capacities of sites 1 and 2 (mol kg<sup>-1</sup>),  $b_1$  and  $b_2$  are the affinity coefficients of sites 1 and 2 (1/kPa),  $n_1$  and  $n_2$  are the deviations from an ideal homogeneous surface.

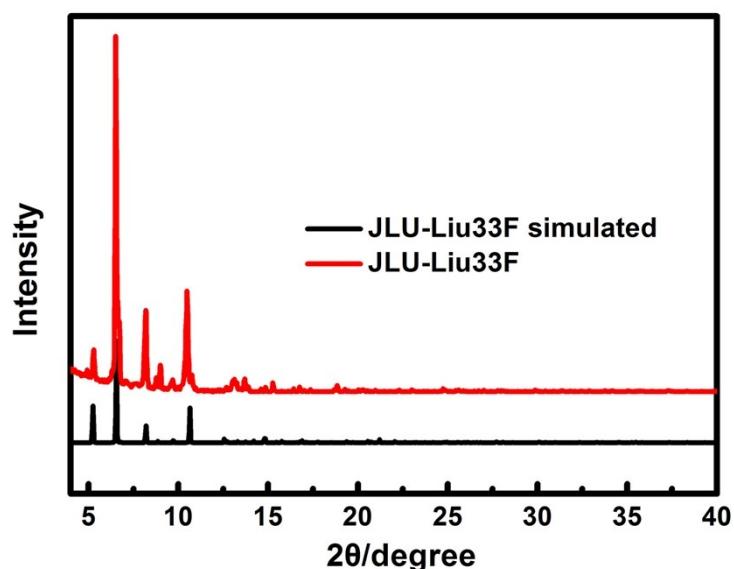

The selectivity of preferential adsorption of component 1 over component 2 in a mixture containing 1 and 2, perhaps in the presence of other components too, can be formally defined as

$$S = \frac{q_1/q_2}{p_1/p_2}$$

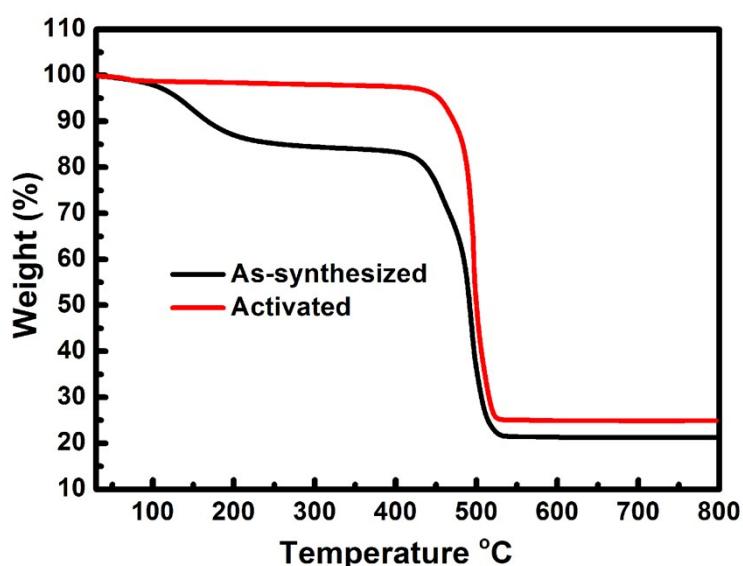

$q_1$  and  $q_2$  are the absolute component loadings of the adsorbed phase in the mixture. These component loadings are also termed the uptake capacities. We calculate the values of  $q_1$  and  $q_2$  using the Ideal

Adsorbed Solution Theory (IAST) of Myers and Prausnitz.

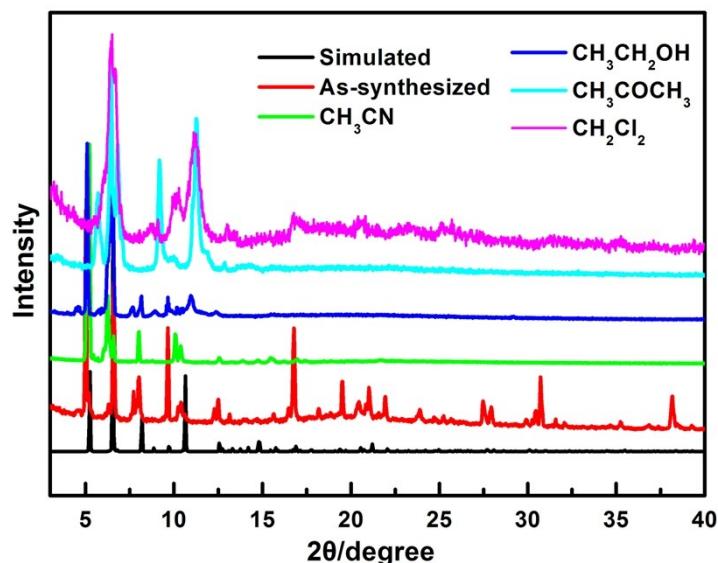

## S2. Supporting Figures

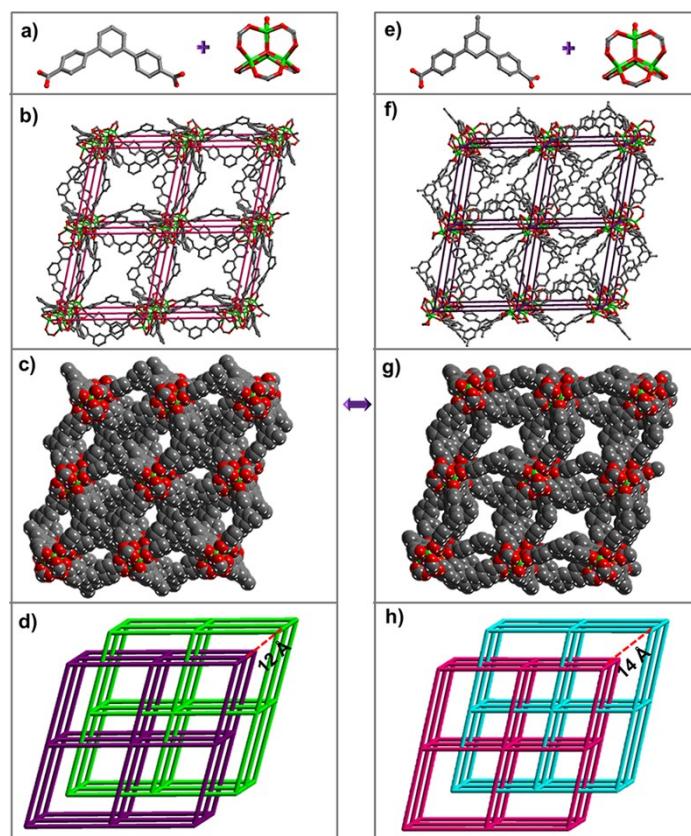

**Fig. S1** PXRD patterns of simulated, as-synthesized sample for **JLU-Liu33F**

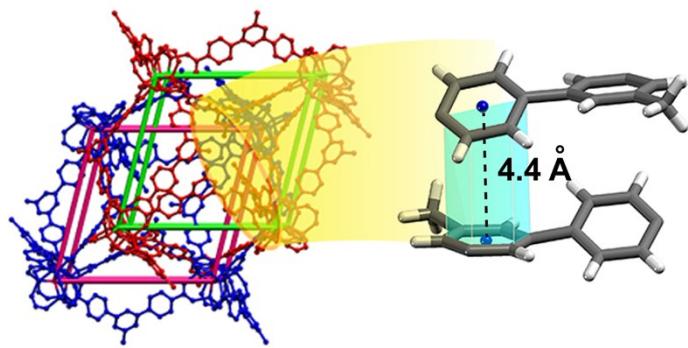

**Fig. S2** TGA curves of **JLU-Liu33F** for the as-synthesized and activated samples.

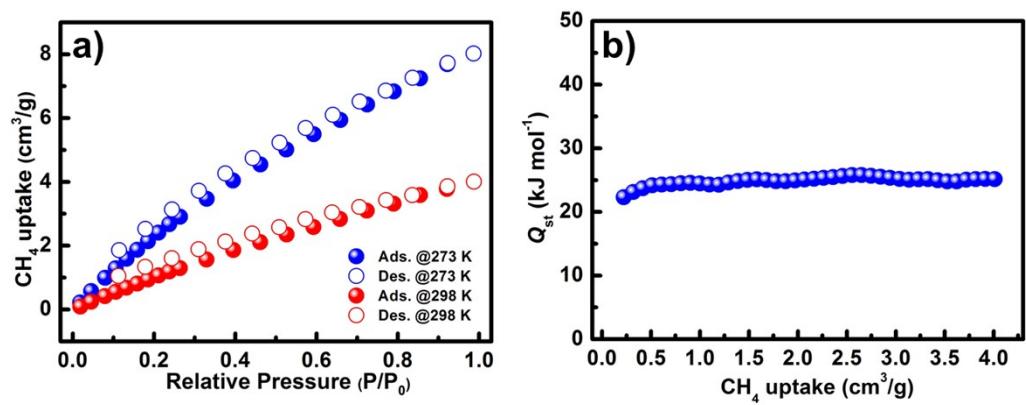

**Fig. S3** PXRD patterns of **JLU-Liu33F** for simulated, as-synthesized and solvent-exchanged samples. **JLU-Liu33F** was stable in ethanol and acetonitrile and was relatively unstable in acetone and dichloromethane.

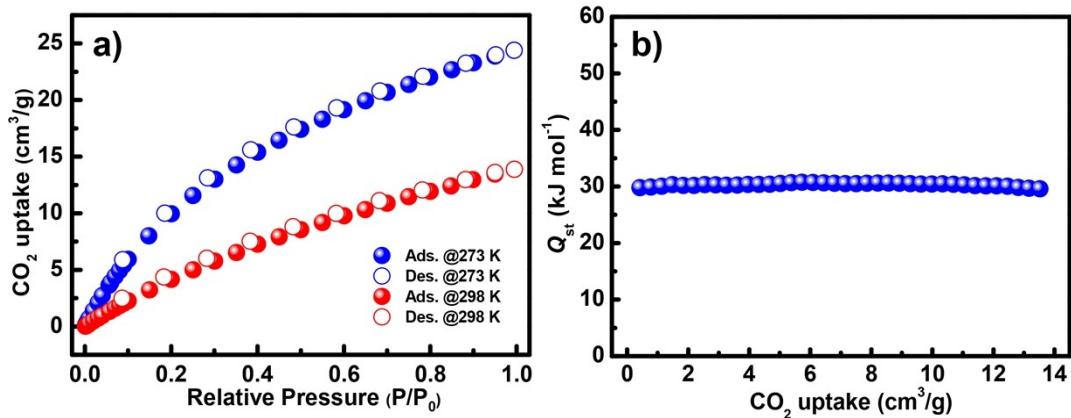

**Fig. S4** Structure comparison of the two materials **JLU-Liu33** (left) and **JLU-Liu33F** (right): a) and e) The V-shaped ligands and Zn<sub>4</sub>O clusters; b) and f) Single net of the framework; c) and g) Space-filling model of the channel for the single net along the [100] direction; d) and h) The difference of interpenetration degree.

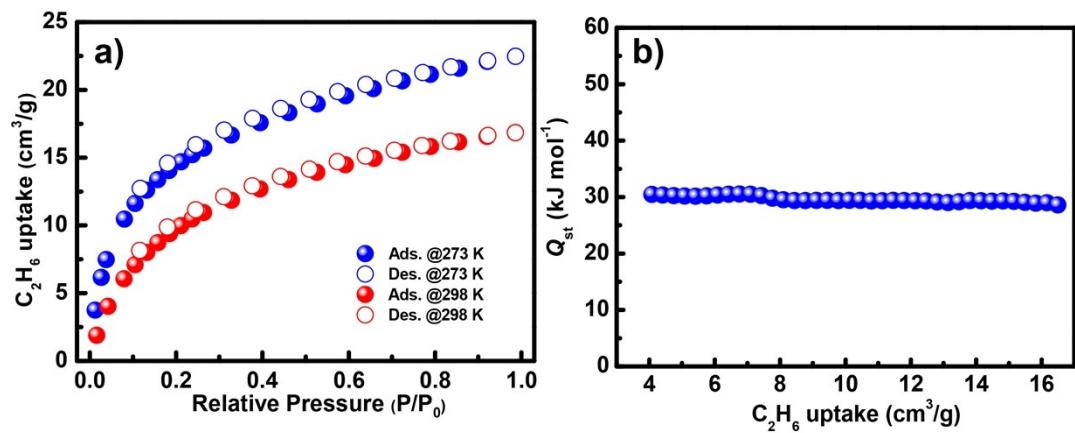

**Fig. S5.** The weak  $\pi \dots \pi$  interactions between the phenyl rings of  $\text{H}_2\text{MDCPB}$  ligands, which belong to two interpenetrated nets of **JLU-Liu33F**.

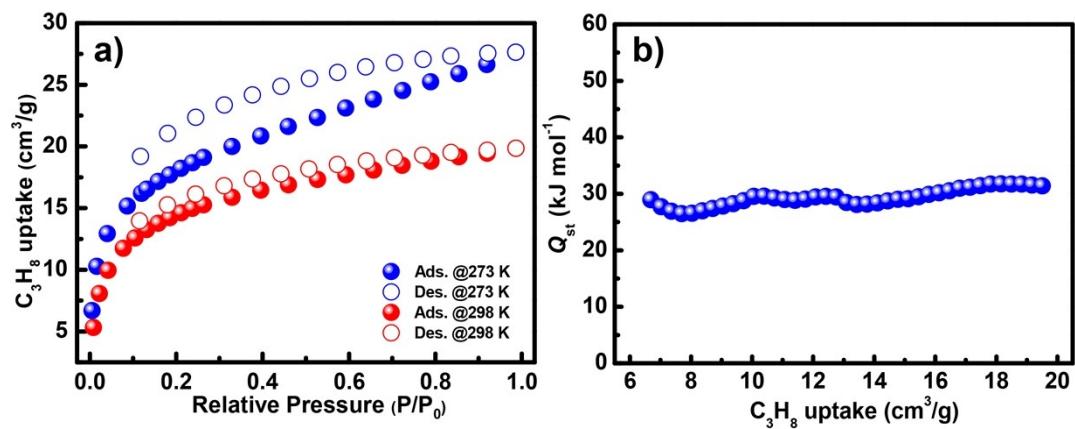

**Fig. S6** (a)  $\text{CH}_4$  adsorption isotherms for **JLU-Liu33F** at 273 and 298 K under 1 bar and (b)  $Q_{st}$  of  $\text{CH}_4$  for **JLU-Liu33F**.

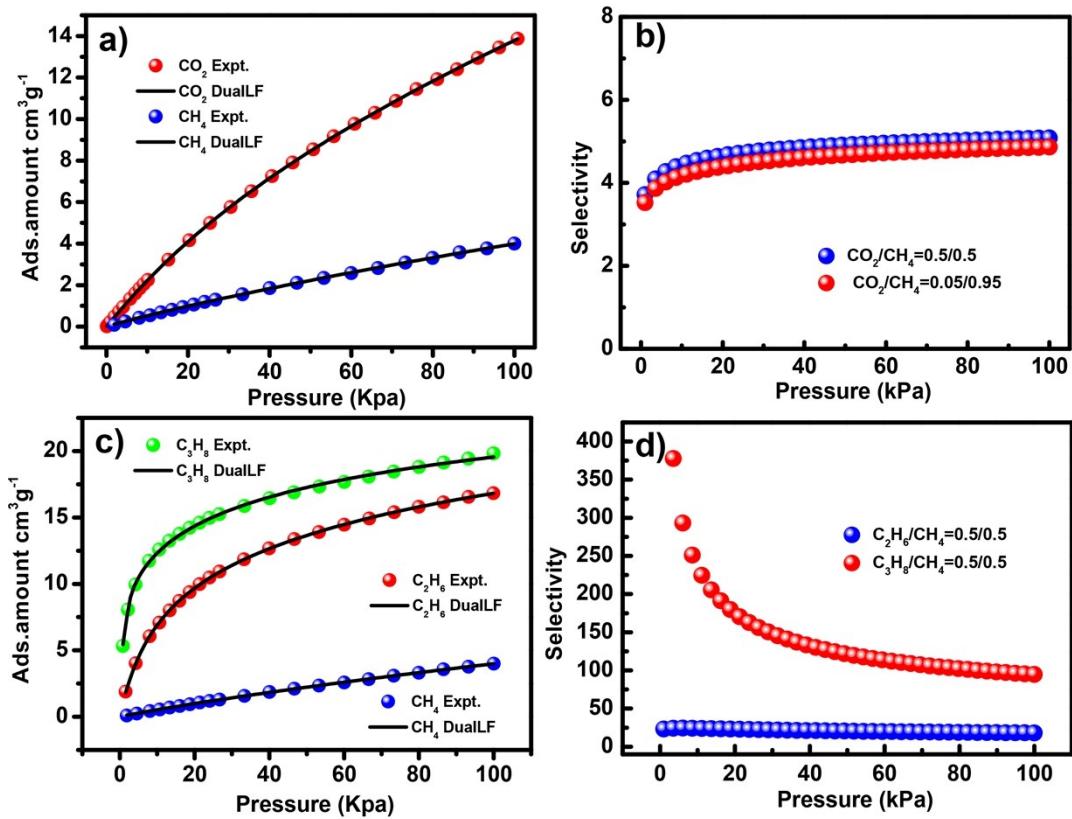

**Fig. S7** (a)  $\text{CO}_2$  adsorption isotherms for **JLU-Liu33F** at 273 and 298 K under 1 bar and (b)  $Q_{st}$  of  $\text{CO}_2$  for **JLU-Liu33F**.

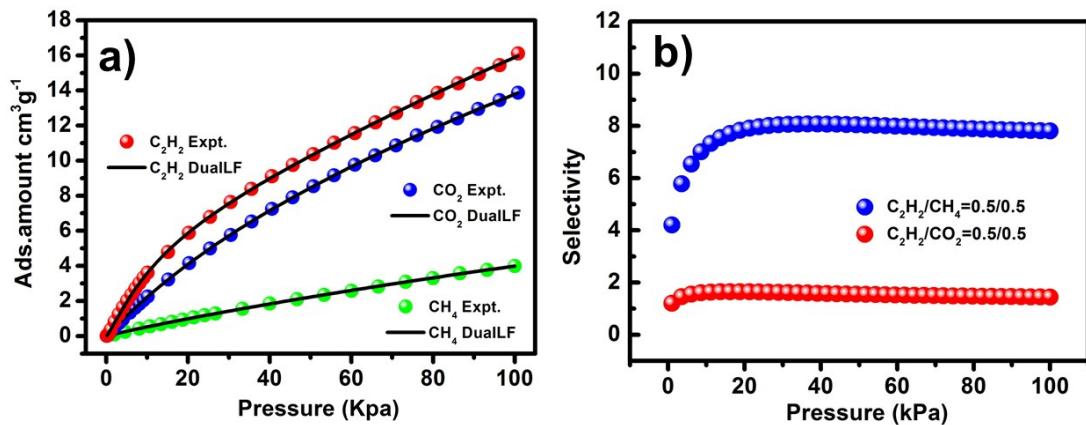

**Fig. S8** (a) C<sub>2</sub>H<sub>6</sub> adsorption isotherms for **JLU-Liu33F** at 273 and 298 K under 1 bar and (b)  $Q_{st}$  of C<sub>2</sub>H<sub>6</sub> for **JLU-Liu33F**.

**Fig. S9** (a) C<sub>3</sub>H<sub>8</sub> adsorption isotherms for **JLU-Liu33F** at 273 and 298 K under 1 bar and (b)  $Q_{st}$  of C<sub>3</sub>H<sub>8</sub> for **JLU-Liu33F**.

**Fig. S10**  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$  and  $\text{C}_3\text{H}_8$  adsorption isotherms at 298 K along with the dual-site Langmuir-Freundlich (DSLF) fits (a and c); gas mixture adsorption selectivity are predicted by IAST at 298 K and 100 kPa for **JLU-Liu33F** (b and d).

**Fig. S11** (a)  $\text{C}_2\text{H}_2$ ,  $\text{CO}_2$  and  $\text{CH}_4$  adsorption isotherms at 298 K along with the dual-site Langmuir-Freundlich (DSLF) fits; (b)  $\text{C}_2\text{H}_2/\text{CH}_4$  and  $\text{C}_2\text{H}_2/\text{CO}_2$  adsorption selectivity are calculated by IAST at 298 K and 1 bar for **JLU-Liu33F**.

### S3. Supporting Tables

After refining the crystal with the modern version refinement engine, the main CheckCIF A alerts have been solved. However, there still exists B alerts in the report. The B-level errors in the crystal data according to their checkCIF/PLATON report has been explained in the ESI: The bond length unrealistic is ascribed to weak CH···π interactions between the phenyl rings of H<sub>2</sub>MDCPB ligands which belongs to two interpenetrated nets. The CH···π interactions lead to the deformation of the phenyl rings, so the C31-C34 bond length is longer. There also exists “Low bond precision on C-C Bonds” problems in the check report, but it will not influence the accuracy of the JLU-Liu33F structure.

**Table S2.** Selected bond lengths [Å] and angles [°] for **JLU-Liu33F**.
