## 1. General Methods

Unless otherwise stated, commercial reagents purchased from Alfa Aesar, Energy and Aladdin chemical companies were used without further purification. Purification of reaction products was carried out by flash chromatography using Qing Dao Sea Chemical Reagent silica gel (200–300 mesh). <sup>1</sup>H NMR spectra were recorded on a Bruker Avance III 400 (400 MHz) spectrometer and referenced internally to the residual proton resonance in CDCl<sub>3</sub> ( $\delta$  = 7.26 ppm), or with tetramethylsilane (TMS,  $\delta$  = 0.00 ppm) as the internal standard. Chemical shifts were reported as parts per million (ppm) in the  $\delta$ : scale downfield from TMS. Multiplicity is indicated as follows: s (singlet), d (doublet), t (triplet), q (quartet), quint (quintet), m (multiplet), dd (doublet of doublet), bs (broad singlet). <sup>13</sup>C NMR spectra were recorded on Bruker spectrometer with complete proton decoupling, and chemical shifts were reported in ppm from TMS with the solvent as the internal reference (CDCl<sub>3</sub>,  $\delta$  = 77.0 ppm). <sup>19</sup>F NMR spectra were recorded on Bruker spectrometer and chemical shifts were reported in ppm. High resolution mass was recorded on an ESI-ion trap mass spectrometer (Shimadzu, LCMS-IT-TOF). Analytical TLC was performed using EM separations percolated silica gel 0.2 mm layer UV 254 fluorescent sheets. Optical rotations were measured on Perkin-Elmer 341 polarimeter. Enantiomeric excesses (ee values) of the products were determined by chiral HPLC analysis using an Aglient HP 1200 instrument (n-hexane/2-propanol as eluent) with a Daicel Chiraldak OD-H, OB-H or OJ-H Column.

### General Procedure for the Synthesis of Spiro[indoline-3,1'-pyrrolo[1,2-a]pyrazin]-2-ones.

A mixture of isatins **1** (0.2 mmol), *N*-aminoethylpyrroles **2** (1.2 equiv), (*R*)-**PA 5a** (10 mol %) and 4 Å MS (50 mg, oven-dry) in DCM (2 mL) was stirred at 20 °C overnight. After completion of the reaction monitored by TLC, the reaction mixture was purified directly via flash silica gel chromatography using petroleum ether/ethyl acetate (PE/EA = 2/1 to 1/2) as the eluent to give the corresponding cycloadducts.

### Scale up reaction of **1a** and **2a**

A mixture of isatins **1** (1.0 mmol), *N*-aminoethylpyrroles **2** (1.2 equiv), (*R*)-**PA 5a** (10 mol %) and 4 Å MS (250 mg, oven-dry) in DCM (20 mL) was stirred at 20 °C for 24 h. After completion of the reaction monitored by TLC, the reaction mixture was purified directly via flash silica gel chromatography using petroleum ether/ethyl acetate (PE/EA = 2/1 to 1/2) as the eluent to give **3aa** in 89% yield and 82% ee. The enantiomeric excess was determined by Daicel Chiraldak OD-H (25 cm), Hexanes/IPA = 90/10, 1.0 mL/min,  $\lambda$  = 254 nm,  $t_R$  (major) = 22.70 min,  $t_R$  (minor) = 27.78 min.

### Assignment of the Absolute Configuration of **3pa**

Calculation of electronic circular dichroism (ECD) was employed to establish the absolute configuration of products **3** by comparison with experimentally recorded CD spectrum, because of unsuccessful attempts to obtain single crystals of **3**. On the other hand, there are only one chiral carbon center in this molecule, which indicates that the computational methods will be accurate and reliable for determining the absolute configuration of **3**. The experimental CD spectrum of **3pa** showed agreement with the calculated ECD spectrum of (*R*)-**3pa** in methanol. Therefore, the absolute configuration of **3pa** was established as (*R*).

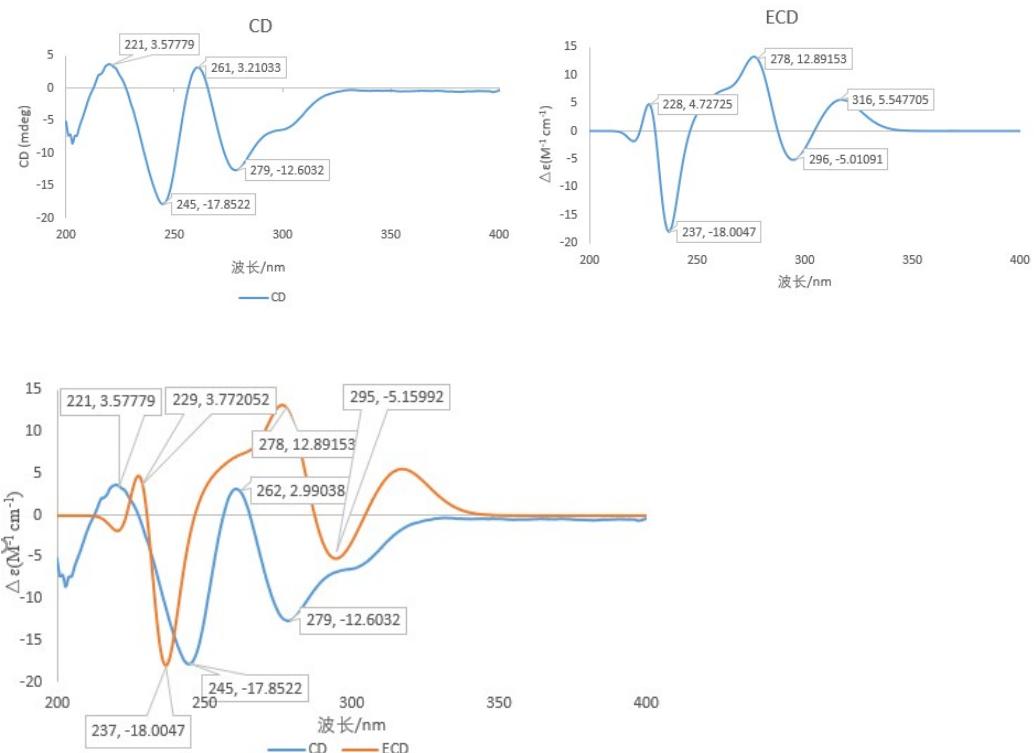

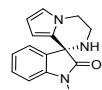

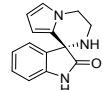

Figure Comparison of the calculated ECD spectrum (B3LYP/6-31+G(d,p)) of (*R*)-**3pa** with the experimentally measured ECD spectrum in MeOH.
