## Contents

1. Test the impact of different computational methods .....	S2
2. The possible reaction pathways via TS1'-O and TS1'-N .....	S3
3. Chemoselective addition reaction pathways catalyzed by the real system .....	S4
4. Compared the hydrogen bond between Int1 and ADD2-O .....	S5
5. Parr function analysis.....	S6
6. Cartesian coordinates (Å) of the computed structures.....	S7-111
7. Absolute energies and Imaginary frequency for the computed structures ...	S112-113

## 1. Test the impact of different computational methods

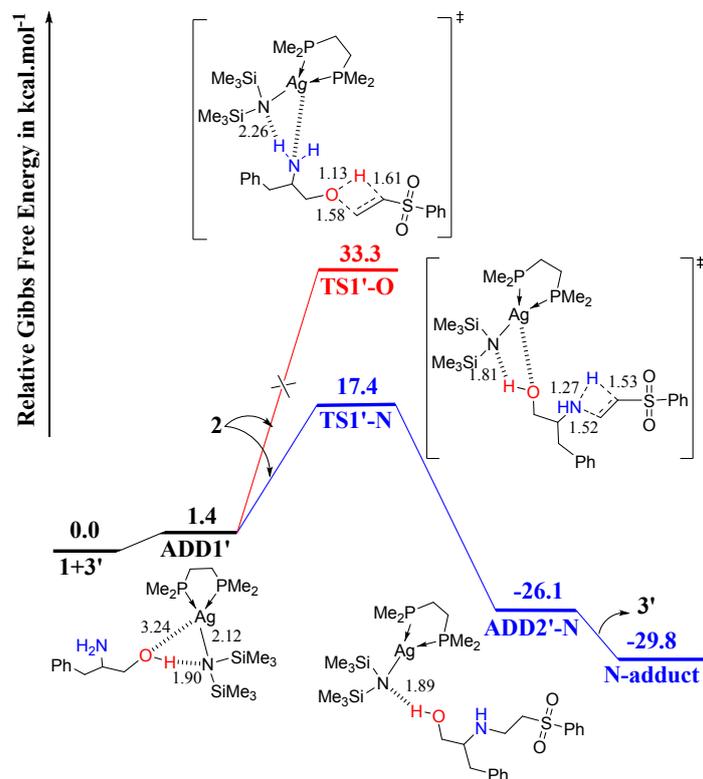

**Table S1.** Relative free energies ( $\Delta G$ ) [ $\text{kcal}\cdot\text{mol}^{-1}$ ] between TS1-O and **1+3'** geometries at the different theory levels.

$\Delta G$	Method1	Method2	Method3
TS3	11.8	11.1	10.7
1+3'	0.0	0.0	0.0

Method1: Geometry B3LYP/SDD,6-31g(d), single point energies in solution M06/SDD,6-31+g(d,p).  
Method2: Geometry B3LYP/SDD,6-31g(d), single point energies in solution B97D/SDD,6-31+g(d,p).  
Method3: Geometry B3LYP/SDD,6-31g(d), single point energies in solution B3LYP-D3/ SDD,6-31+g(d,p).

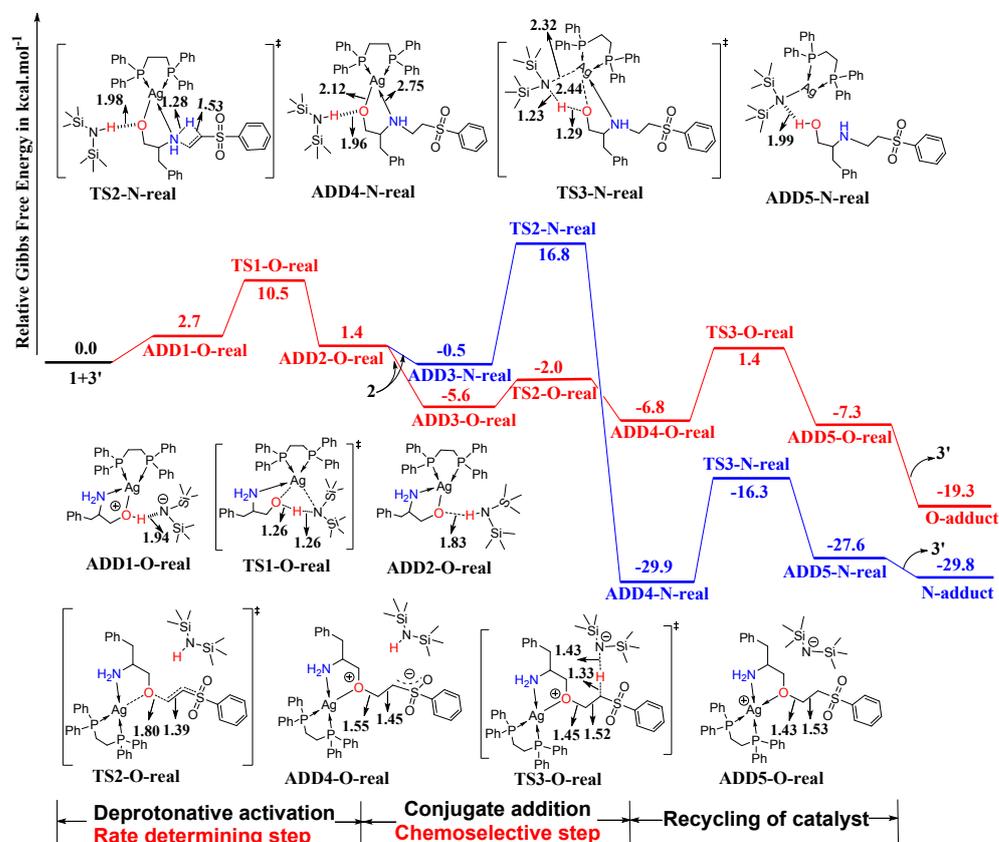

To test the impact of different computational methods on the calculated results, we additionally computed the rate-determining step by using different computational methods. As summarized in **Table S1**, the free energies calculated by the different methods are very close and have small differences, which indicate that the calculated results should be reliable by using the selected computational method.

## 2. The possible reaction pathways via TS1'-O and TS1'-N

**Fig. S1** Computed Gibbs free-energy profiles (253 K) for the possible reaction pathways via TS1'-O and TS1'-N catalyzed by **3'** (distances in Å).

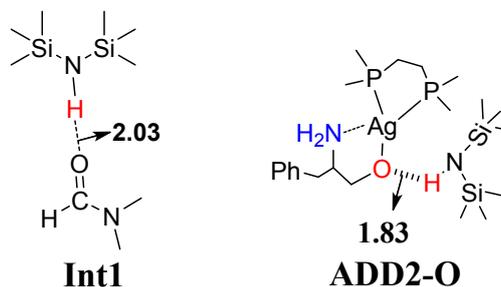

### 3. Chemoselective addition reaction pathways catalyzed by the real system

**Fig. S2** Computed free-energy profiles (253 K) for chemoselective addition reactions catalyzed by **3** system (distances in Å).

We additionally reoptimized all the structures depicted in **Fig. 2** with the actual dppe ligand by using catalyst **3**. The computed free-energy profiles and energy barriers (**Fig. S2**) showed the same trend and conclusions as the calculated results of the model systems. This indicates that the selected models and the computed results should be suitable and reliable.

#### 4. Compared the hydrogen bond between Int1 and ADD2-O

**Fig. S3** Computed structures of Int1 and ADD2-O (distances in Å).

In order to study if the  $\text{HN}(\text{SiMe}_3)_2$  molecule bonded to O atom of adduct or to DMF solution, we compared the hydrogen bond of Int1 (2.03 Å) with that of ADD2-O (1.83 Å), the hydrogen bond of ADD2-O is stronger than that of Int1, so the  $\text{HN}(\text{SiMe}_3)_2$  molecule hydrogen bonded to O atom of adduct is more favorable than hydrogen bonded to DMF.

## 5. Parr function analysis

Pioneered by Domingo and coworkers, the nucleophilic ( $P_k^-$ ) and electrophilic ( $P_k^+$ ) Parr functions which allow for the characterization of the nucleophilic and electrophilic sites of a molecule, can be obtained through the analysis of Mulliken atomic spin density (ASD) of the corresponding radical cations (RC) or anions (RA) of the studied molecules, separately. According to Domingo's definition, the Parr functions can be expressed by the following equations:

$$P^-(r) = \rho_S^{rc}(r) \text{ for the electrophilic attacks} \quad (1)$$

$$P^+(r) = \rho_S^{ra}(r) \text{ for the nucleophilic attacks} \quad (2)$$

where  $\rho_S^{rc}(r)$  is the ASD of the radical cation and  $\rho_S^{ra}(r)$  is the ASD of the radical anion. Each ASD condensed at the different atoms of the radical cation and radical anion provides the local nucleophilic  $P_k^-$  and electrophilic  $P_k^+$  Parr functions of the neutral system, respectively.

## 6. Cartesian coordinates (Å) of the computed structures
