1. General Comments

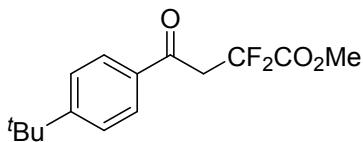

All the reactions were carried out in oven-dried sealed tube with Teflon-lined septum under N₂ atmosphere. Unless indicated, all materials were obtained from commercial sources and used as received. Superdry dimethyl sulfoxide with molecular sieves in it was used in the reaction. ¹H NMR and ¹³C NMR spectra were recorded on 400 MHz at ambient temperature with CDCl₃ as the solvent. ¹⁹F NMR spectra were recorded on 600 MHz at ambient temperature with CDCl₃ as the solvent. Chemical shifts (δ) were given in ppm, referenced to the residual proton resonance of CDCl₃ (7.26), to the carbon resonance of CDCl₃ (77.16). Coupling constants (J) were given in Hertz (Hz). The term m, q, t, d, s referred to multiplet, quartet, triplet, doublet, singlet. The reaction progress was monitored by GC-MS if applicable. Column chromatography was performed with silica gel (200-300 meshes). Thin layer chromatography (TLC) was visualized using UV light.

2. Experimental Section

General procedure for the keto-difluoromethylation of alkenes

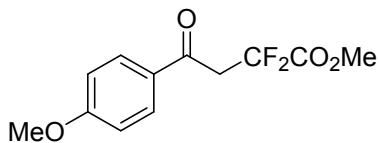

An oven-dried Schleck tube equipped with a stirrer bar was charged with 4.58 mg *fac*-Ir(ppy)₃(3.5 mol%), which was degassed and refilled with N₂ for 3 times. The alkenes **1a-1x** (0.2 mmol, 1.0 equiv.), Chen reagent FSO₂CF₂COOMe (134.4 mg, 0.7 mmol, 3.5 equiv.) and dry DMSO (4 mL) were added under N₂. The resulting mixture was irradiated for 6 h under room temperature by 3 W blue LEDs. Quenching the reaction with sat. aq. NaHCO₃ and dichloromethane (DCM) was added. The aqueous layer was extracted with DCM twice. The combined organic layer dried by Na₂SO₄, and concentrated in *vacuo* and the residue was purified by chromatography on silica gel to give product **3a-3x**, which were identified by ¹H, ¹³C, and ¹⁹F NMR.

Control experiments for insight on reaction mechanism

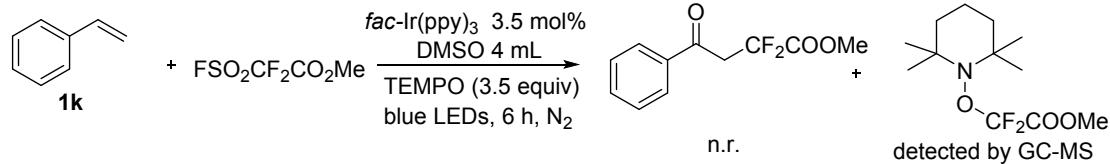

a) The experiment of turn on and off the light

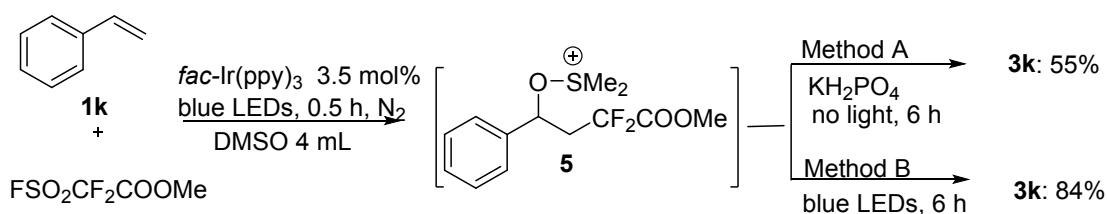

An NMR tube was charged with 0.6 mg *fac*-Ir(ppy)₃ (3.5 mol%) which was degassed and refilled with N₂ for 3 times. Styrene **1k** (2.6 mg, 0.025 mmol, 1.0 equiv), Chen reagent FSO₂CF₂CO₂Me (16.8 mg, 0.0875 mmol, 3.5 equiv.) and dry d6-DMSO (0.5 mL) were added under N₂. The resulting mixture was alternately irradiated with 3 W blue LEDs and set in dark totally for 12 h. The yield of **3k** was confirmed by ¹H NMR analysis of the crude sample using dibromomethane as internal standard.

b) Control experiment with TEMPO

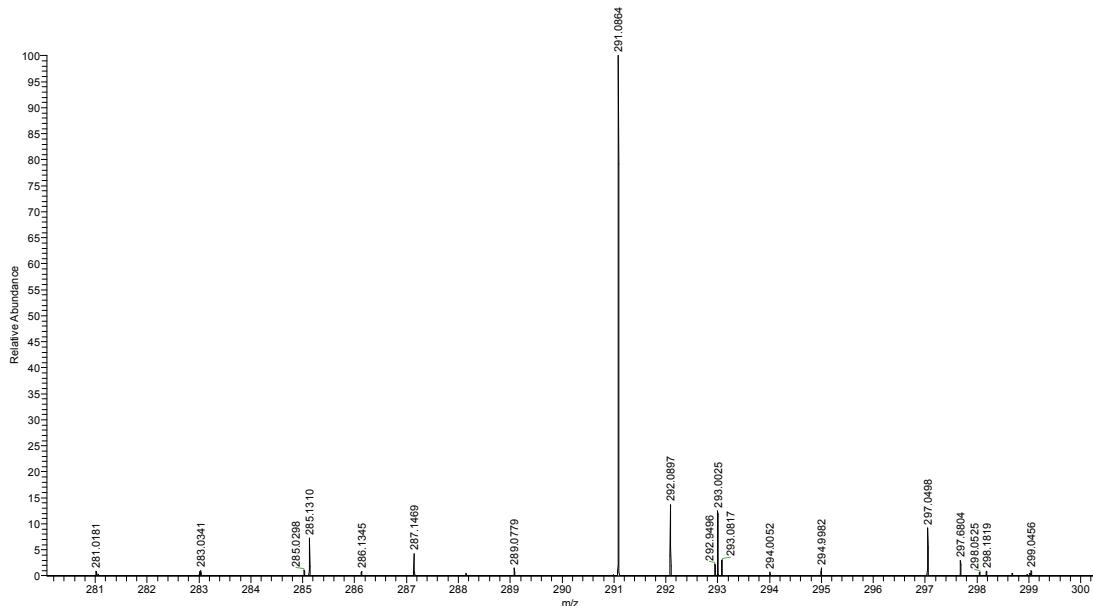

An oven-dried Schleck tube equipped with a stirrer bar was charged with 4.58 mg *fac*-Ir(ppy)₃(3.5 mol%) and TEMPO (109.2 mg, 0.7 mmol, 3.5 equiv.), which was degassed and refilled with N₂ for 5 times. The alkenes **1k** (0.2 mmol, 1.0 equiv.), Chen's reagent FSO₂CF₂CO₂Me (134.4 mg, 0.7 mmol, 3.5 equiv.) and dry DMSO (4 mL) were added under N₂. The resulting mixture was irradiated for 6 h under room temperature by 3 W blue LEDs. Upon completion of the reaction, detect the reaction mixture with GC-MS.

c) The detection and transformation of alkoxysulfonium ion intermediate **5**.

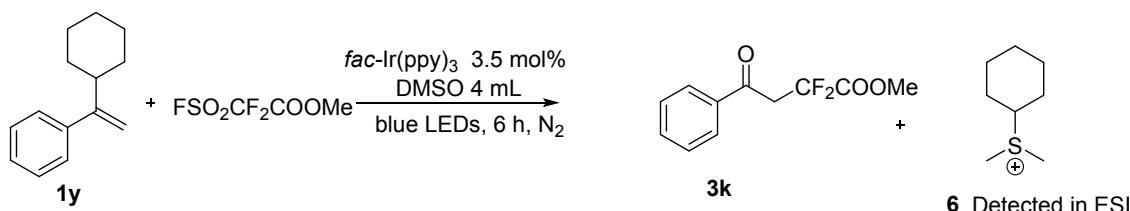

Oven-dried Schleck tube equipped with a stirrer bar was charged with 4.58 mg *fac*-Ir(ppy)₃ (3.5 mol%) which was degassed and refilled with N₂ for 3 times. The styrene **1k** (0.2 mmol, 1.0 equiv.), Chen reagent FSO₂CF₂CO₂Me (134.4 mg, 0.7 mmol, 3.5 equiv.) and dry DMSO (4 mL) were added under N₂. The mixture was irradiated for 0.5 h under room temperature by 3 W blue LEDs. Detect the reaction mixture by NMR and ESI. HRMS Calculated for cation **5** C₁₃H₁₇F₂O₃S⁺ 291.0861, observed 291.0864, in the case the **3k** was observed by NMR in 32% yield. Add KH₂PO₄ (54.4 mg, 0.4 mmol, 2.0 equiv.) to the first tube. The other one was irradiated for 6 h under room temperature by 3 W blue LEDs. They give the product **3k** in 55% and 84% yields, respectively.

- d) The reaction of (1-cyclohexylvinyl)benzene with Chen reagent under the photocatalytic reaction condition

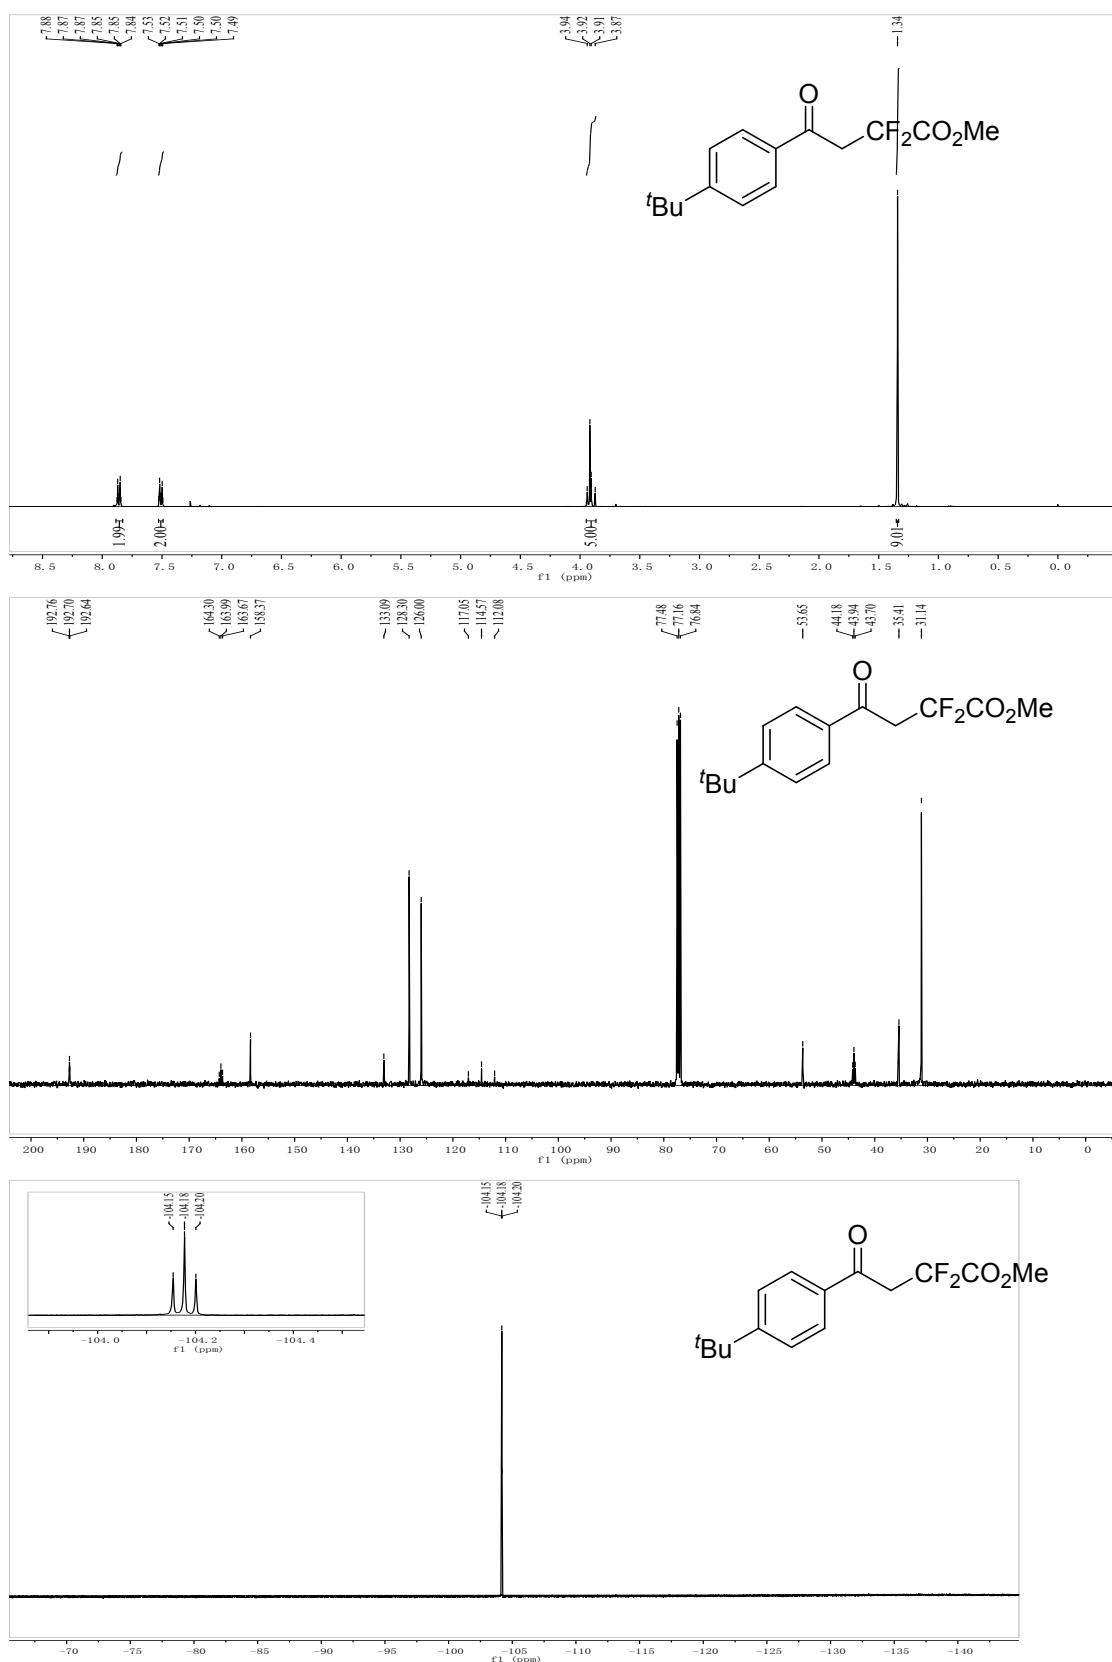

An oven-dried Schleck tube equipped with a stirrer bar was charged with 4.58 mg *fac*-Ir(ppy)₃(3.5 mol%) which was degassed and refilled with N₂ for 3 times. The (1-cyclohexylvinyl)benzene **1y** (37.2 mg, 0.2 mmol, 1.0 equiv.), Chen reagent FSO₂CF₂CO₂Me (134.4 mg, 0.7 mmol, 3.5 equiv.) and dry DMSO (4 mL) were added under N₂. The resulting mixture was irradiated for 6 h under room temperature by 3 W blue LEDs. Upon completion of the reaction, detect the reaction mixture by NMR and ESI. Quenching the reaction with sat. aq. NaHCO₃ and dichloromethane (DCM) was added. The aqueous layer was extracted with DCM twice. The combined organic layer dried by Na₂SO₄, and concentrated in *vacuo* and the residue was purified by chromatography on silica gel. Product **3k** was obtained. HRMS Calculated for cation **6** C₈H₁₇S⁺ 145.1048, observed 145.1053.
