Quantum yield calculation:

In a photochemical process, the quantum yield is the number of electrons that produced molecules divided by the number of photons absorbed by the system. Since not all photons are absorbed productively, the typical quantum yield should be less than 100%.

η = number of electrons produced/ number of photons absorbed

OR

$\eta = [(2 * \text{the no. H}_2 \text{ Molecules Produced}) / (\text{the No. of photons absorbed})] * 100$

$$\eta = \frac{r}{J} = \frac{2.9 \times 10^{15}}{2.4 \times 10^{16}} \times 100\% = 12.1\%$$

Where $r = 2.9 \times 10^{15}$ and $J = 2.4 \times 10^{16}$
