**Table S2** E<sub>base</sub>, E<sub>ads</sub>, E<sub>total</sub> ΔE<sub>ads</sub> and ΔG<sub>H</sub> for HER on Pt (111) surface, WO<sub>3</sub>-W (001) surface, WO<sub>3</sub>-O (001) surface, W<sub>2</sub>C-C (001) surface and W<sub>2</sub>C-W (001) surface by DFT calculation.

**Theoretical calculations:** Our computational simulations were performed by Vienna ab-initio simulation package (VASP) with the projector augmented wave pseudo-potentials (PAW) to describe the interaction between atomic cores and valence electrons with density functional theory (DFT). The Perdew–Burke–Ernzerhof (PBE) functional within the generalized gradient approximation (GGA) was used to implement DFT calculations.<sup>9</sup> The W<sub>2</sub>C(001) by the W-determined or C-determined, Pt(111) and WO<sub>3</sub>(001) 2×2 slab models were employed to simulate the surface properties. The reasonable vacuum layers were set around 15 Å in the z-direction for avoiding interaction between planes. A cutoff energy of 400 eV was provided and a 5×5×1 Monkhorst Pack k-point sampling was chosen for the well converged energy values. Geometry optimizations were pursued until the force on each atom falls below the convergence criterion of 0.02 eV/Å and energies were converged within 10<sup>-6</sup> eV. Moreover, all calculations were spin polarized.

### Hydrogen adsorption and free energy

The hydrogen adsorption energy on various surfaces is defined as

$$\Delta E_{ads} = E_{base-H} - E_{base} - \frac{1}{2}E_{H_2}$$

where  $E_{base-H}$  is the total energy of slab model with \*H adsorption,  $E_{base}$  is the energy of a clean slab surface, and  $E_{H_2}$  is that for hydrogen molecules in the gas phase.

The Gibbs free energy for hydrogen adsorption ( $\Delta G_{H^*}$ ) can be calculated by taking zero point energy and entropy corrections into account such that  $\Delta G_H = \Delta E_{ads} + \Delta E_{ZPE} - T\Delta S$ . Where  $\Delta E_{ZPE}$  and  $T\Delta S$  are the difference in zero point

energy and entropy between the adsorbed hydrogen and hydrogen in the gas phase, respectively. As the vibrational entropy of H\* in the adsorbed state is small, the

entropy of adsorption of  $1/2 H_2$  is  $\Delta S_H \approx \Delta E_{ads} + 0.24 eV$ .<sup>10,11</sup>
