On the Cost of Academic Methodologies

Olivier Berger, Karen R. Winters, Axel Sabourin, Sergei V. Dzyuba,* and Jean-Luc Montchamp*

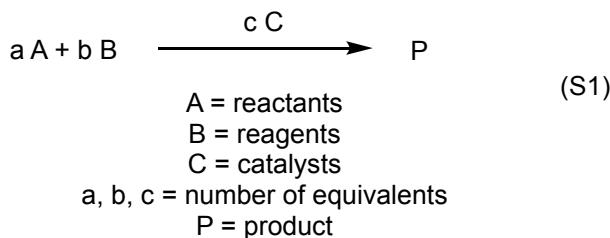

Table of Contents:

Definitions & Formulas.....	Page 2
Note about Stereoselectivity.....	Page 3
Detailed Calculations of CAM for Scheme 1.....	Page 4
Table S1: 2009 Periodic Table Cost of Transition Metal Chlorides.....	Page 5
Table S2: 2018 Periodic Table Cost of Transition Metal Chlorides.....	Page 5
Table S3: 2018 Periodic Table Cost of Metal Chlorides (Complete).....	Page 6
Table S4: Cost of Common Phosphorus Compounds in 2009, 2012, and 2018.....	Page 7
Table S5: Cost of Common Catalysts and Precursors in 2009 and 2018.....	Page 8
Table S6: 2018 Prices in US Dollars of Common Chemicals.....	Pages 9 - 37

Definitions & Formulas:

NOT INCLUDED in the calculations:

- a) cost of standard reagents (Et_3N , $i\text{-Pr}_2\text{NEt}$, NaOH , KOH , HCl , AcOH , etc.) and solvents. In general, chemicals costing less than 5 \$/mol are not considered because the overall contribution to CAM is negligible.
- b) costs of isolation and purification of the product.
- c) material hazards and associated additional shipping costs.
- d) reaction times, activation and heating methods, etc.
- e) reaction scale. Although scalability of the chemical methodologies is of the utmost importance for all practical considerations, this information may not be routinely provided in literature accounts.

$$\text{CAM} = \frac{\sum (bB + cC) (\$/\text{mol})}{1 \text{ or yield}} \quad (\text{S2})$$

$$\text{CAM}^* = \frac{\sum (aA + bB + cC) (\$/\text{mol})}{\text{yield}} \quad (\text{S3})$$

$$\text{AMW} = \sum (bB + cC) (\text{g/mol}) \quad (\text{S4})$$

$$\text{AMW}^* = \sum (aA + bB + cC) (\text{g/mol}) \quad (\text{S5})$$

We note that these calculations are very easy to accomplish. Whereas Table S6 certainly may be used to calculate CAM and AMW, the information could be gathered via vendors' websites within minutes.

Note about stereoselective methodologies (ee's and de's):

The issue of accounting for ee (or de) of the product in CAM calculations depends on the specific approaches (if any) that would be used to increase the ee % after the reaction. In a number of cases, the differences might not be sufficiently large, and thus could be ignored. In general, any ee values above 95 % could be treated as equal.

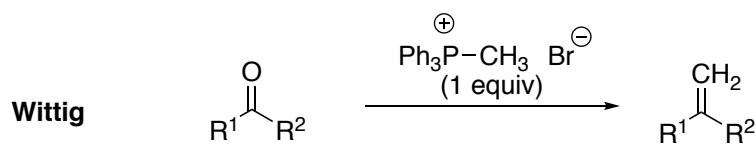

In cases where significantly different ee-values are obtained, the cost associated with approaches/reagents/methods to increase ee-values should be considered.

For example:

- a) it is known that simple crystallization might increase ee (for a review, see: Y. Wang and A. M. Chen, *Org. Process Res. Dev.*, 2008, **12**, 282–290); and in this instance the cost of solvent can be disregarded, and hence contribution of the recrystallization step(s) to overall CAM would be zero. As an example, see Scheme 7 in the manuscript.
- b) if resolving agents are used during the recrystallization step(s) (for some reviews, see: R. Siedlecka, *Tetrahedron*, 2013, **69**, 6331–6363; and E. Vedejs and M. Jure, *Angew. Chem. Int. Ed.*, 2005, **44**, 3974–4001), the costs of those agents should be included in CAM calculations, and the overall yield should be considered for CAM.
- c) if chromatographic techniques are used to get to a particular ee, specifics must be indicated and it would be up to the researcher to decide on which route to take (i.e., to decide how the cost of reagents, catalysts could be related to the cost of purification); the cost of chromatographic purification is outside of the scope of this review.

A detailed calculation of CAM for Scheme 1 is shown in Scheme S1 for two different olefinations as functional-group interconversion.

Since the exact structure of the starting material and product are unspecified, CAM is used (Equation S2 above).

$$\begin{aligned} \text{CAM} &= 71 \text{ \$/mol} \\ \text{AMW} &= 469 \text{ g/mol} \end{aligned}$$

$\text{Ph}_3\text{P}^+\text{CH}_3\text{Br}^-$	$t\text{-BuOK}$
1 equivalent	1 equivalent
64 \\$/mol	7 \\$/mol
357.24 g/mol	112.22 g/mol

$$\begin{aligned} \text{CAM} &= (1 \times 64) + (1 \times 7) = 71 \text{ \$/mol} \\ \text{AMW} &= (1 \times 357.24) + (1 \times 112.11) = 469.35 \text{ g/mol} \end{aligned}$$

$$\begin{aligned} \text{CAM} &= 543 \text{ \$/mol} \\ \text{AMW} &= 2,136 \text{ g/mol} \end{aligned}$$

TiCl_4	CH_2I_2	Zn dust
1.1 equivalent	5 equivalents	9 equivalents
33 \\$/mol	96 \\$/mol	3 \\$/mol
189.73 g/mol	267.84 g/mol	65.35 g/mol

$$\begin{aligned} \text{CAM} &= (1.1 \times 33) + (5 \times 96) + (9 \times 3) = 543.3 \text{ \$/mol} \\ \text{AMW} &= (1.1 \times 189.73) + (5 \times 267.84) + (9 \times 65.35) = 2,136.05 \text{ g/mol} \end{aligned}$$

Scheme S1. Detailed calculations for the comparison of two olefination methods

Table S1. 2009 Periodic Table – The Cost of Transition Metal Chlorides

Sc 14,285	Ti 13	V 520	Cr 120	Mn 8	Fe 2	Co 95	Ni 48	Cu 8	Zn 18

Very Inexpensive < \$100	Inexpensive \$100-300	Expensive \$300-1,000	Very Expensive \$1,000-10,000	Extremely Expensive > \$10,000
--------------------------------	--------------------------	--------------------------	-------------------------------------	--------------------------------------

[a] This table was compiled using the least expensive major US supplier of each chloride (ECl_n). The number below the element's symbol indicates the cost (in US dollar) per mole of ECl_n in its most available oxidation state. See Supporting Information for details.

The differences between Tables S1 and S2:

In 2018, VCl_3 is 245 \$/mol (dark green), but was yellow in 2009

In 2018, MoCl_5 is 375 \$/mol (yellow), but was dark green in 2009

In 2018, TaCl_5 is 1,025 \$/mol (orange), but was yellow in 2009
