## Supporting Figures and Tables

Figure S1. a) Cross-sectional SEM images of the PR film. b) and c) Cross-sectional SEM images of the PCE. d) A photo of PCE.

### Finite-element simulation analysis of the temperature of the laser spot:

A laser beam moved on the PR film substrate to produce a PCE. The laser power and the laser scan rate were recorded as  $P$  and  $v$ , respectively. The surface emissivity of the PR film substrate was  $\varepsilon$ . The transient temperature of the laser spot could be obtained by finite-element simulation.

The incident heat flux of the laser determined the temperature of the surface of the PR film substrate. In the operating wavelength range of the laser, we assumed that the PR film substrate was opaque and the absorptivity was equal to the emissivity. Therefore, no light penetrated the PR film substrate. The PR film substrate absorbed all the heat generated by the laser. The laser thermal load should be multiplied by  $\varepsilon$ .

The energy conservation law as follow:

$$\rho C_p \frac{\partial T}{\partial t} + \rho C_p u \cdot \nabla T + \nabla \cdot q = Q + Q_{ted} \quad (1)$$

Where  $\rho$  is the density of PR,  $C_p$  is the constant pressure heat capacity,  $T$  is temperature,

$t$  is time. Heat flux  $q$  ( $\text{W} \cdot \text{m}^{-2}$ ) is defined as:  $q = -\kappa \nabla T$ , here  $\kappa$  ( $\text{W} \cdot \text{m}^{-1} \cdot \text{K}^{-1}$ ) is heat conductivity. Heat flux of the surface of the PR film substrate is defined as:  $q_0 = \varepsilon \times q$ .

Figure S2. TEM images of PCE.

Figure S3. Thermal gravimetric analysis (TGA) of phenolic resin.

Table S1. TGA data of phenolic resin.

|                 |        |        |        |       |
|-----------------|--------|--------|--------|-------|
| Weight (%)      | 99.99  | 90.00  | 50.00  | 48.58 |
| Temperature (K) | 307.47 | 552.73 | 983.57 | 1073  |

Table S2. The intensity ratio of D/G peak according to Raman spectra of the PCE.

|                 |       |       |       |       |
|-----------------|-------|-------|-------|-------|
| Laser Power (W) | 9     | 12    | 15    | 18    |
| D/G             | 1.039 | 0.862 | 1.052 | 1.012 |

Figure S4. a) C 1s XPS spectra of PCE at different laser power. b) XRD spectra of PCE at different laser power. c) XRD spectra of PCE prepared with the laser power of 12 W

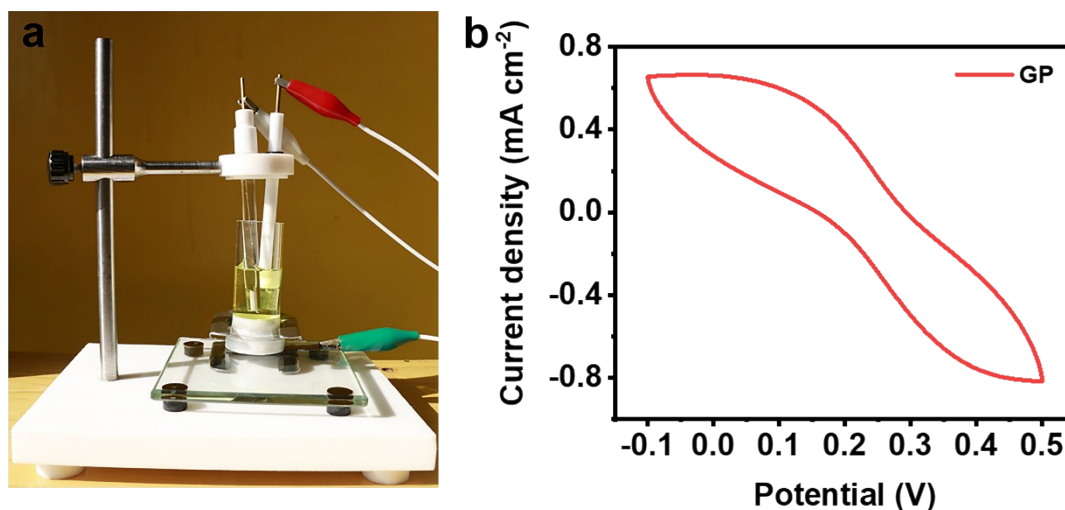

Figure S5. a) The set-up diagram for testing electrochemical properties. b) CV curve of GP substrate in the electrolyte solution (1 mM of potassium ferricyanide) at a scan rate of 50 mV s<sup>-1</sup>.

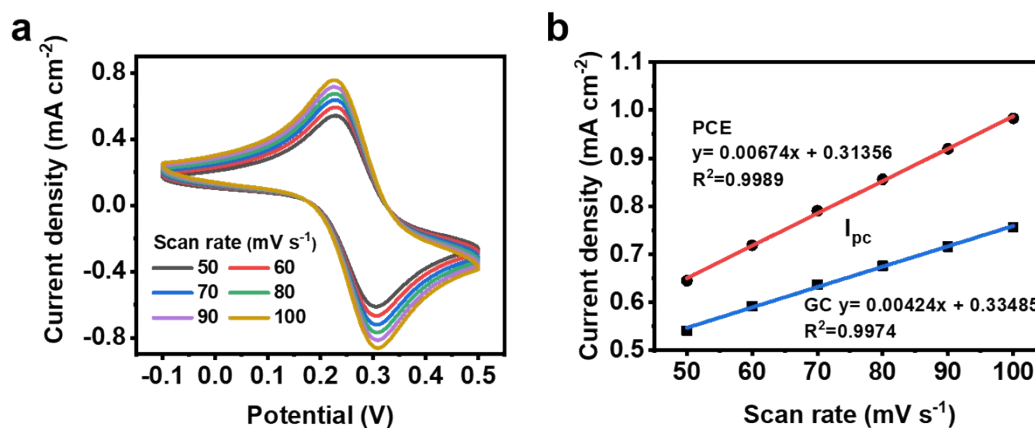

Figure S6. a) GC electrode at a scan rate from 50 to 100  $\text{mv s}^{-1}$ . The CV curves are affected by the electrochemical scan rates in the electrolyte solution (1 mM potassium ferricyanide). b) The relationship between the scan rates and the cathode peak current densities of GC electrode and PCE.

Table S3. The prices of raw materials and GC electrode.

| Material                                   | Price (\$) | Unit         |
|--|------------|--------------|
| Phenolic resin solution                    | 13         | L            |
| Polyimide solution                         | 135        | L            |
| Graphite paper (thickness is 1 mm)         | 9          | $\text{m}^2$ |
| Polyester fiber (thickness is 1 mm)        | 1          | $\text{m}^2$ |
| Glassy carbon electrode (diameter is 3 mm) | 20         | /            |

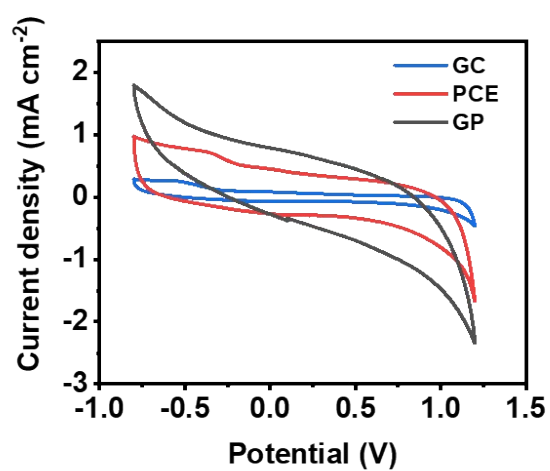

Figure S7. a) CV curves of GC, PCE and GP in 0.01 M PBS (PH=7.4).

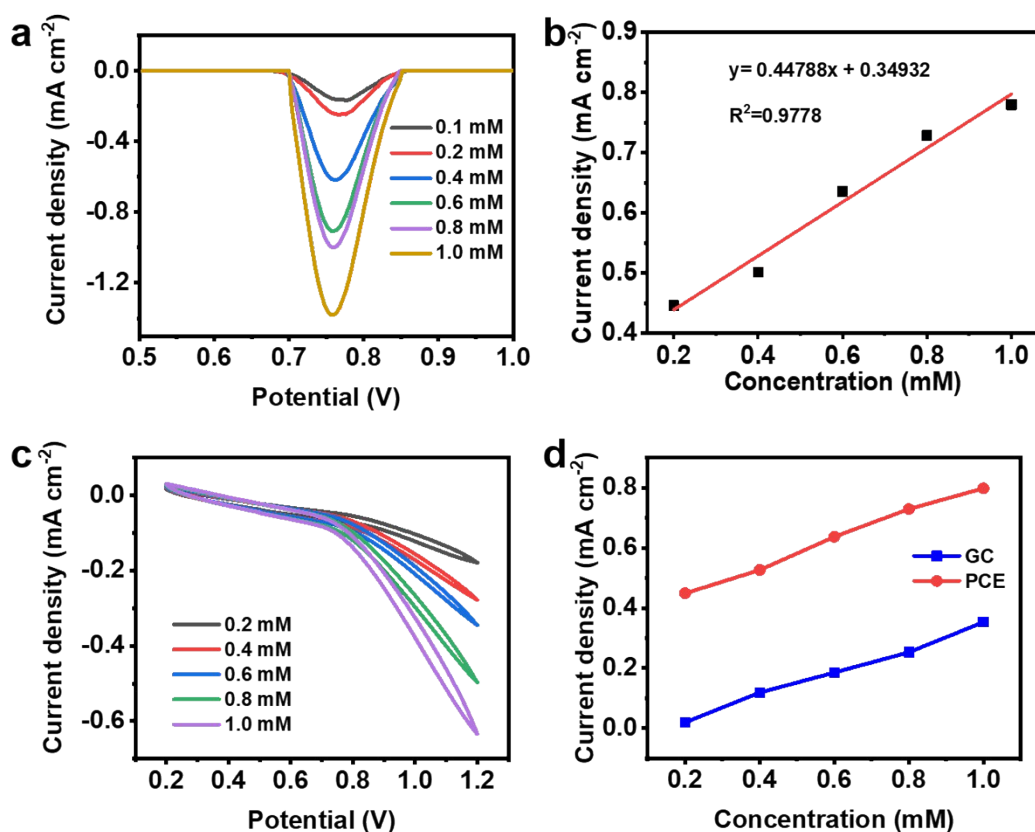

Figure S8. a) DPV curves of PCE with NTT in different concentrations. b) The relationship between the (-) anode peak current densities and the concentrations of NTT obtained from a). c) CV curves of GC with NTT in different concentrations. d) The anode peak current densities between the GC electrode and PCE in different concentrations of NTT solution.

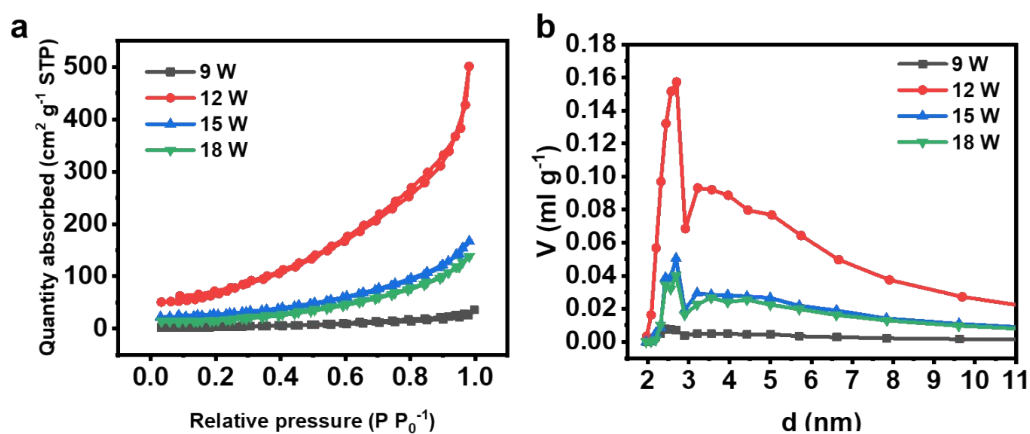

Figure S9. The BET data of PCE. a)  $N_2$  adsorption-desorption isotherms of PCE prepared with different laser power. b) BJH pore size distributions of PCE.

Table S4. The BET data of PCE.

| Laser power (W) | Specific surface ( $m^2 g^{-1}$ ) | Pore diameter (nm) | Pore volume ( $mL g^{-1}$ ) |
|-----------------|-----------------------------------|--------------------|-----------------------------|
| 9               | 14                                | 15.66              | 0.0549                      |

|    |     |       |        |
|----|-----|-------|--------|
| 12 | 283 | 10.95 | 0.7751 |
| 15 | 99  | 10.46 | 0.2577 |
| 18 | 66  | 12.89 | 0.2133 |

Figure S10. a) The relationship between the cathode peak current densities and the concentrations of DA obtained from Figure 2f. b) CV curves of GC with DA in different concentrations at a scan rate of 50 mV s<sup>-1</sup>. c) The cathode peak current densities between the GC electrode and PCE in different concentrations of DA solution at a scan rate of 50 mV s<sup>-1</sup>.

Table S5. Electrochemical parameters of PCE and the electrode materials of reported literature.

| Electrode material        | Electrolyte solution                              | Scan rate<br>(mV s <sup>-1</sup> ) | $\Delta E_p$<br>(mV) | $I_{pa}$<br>(mA cm <sup>-2</sup> ) | $I_{pc}$<br>(mA cm <sup>-2</sup> ) | Ref.      |
