Theoretical Computation

DFT calculations were performed for both Ir(III) complexes and host molecules. Non-metal atoms of C, H, N, F, P and O were described by the all-electron basis set of B3LYP/6-31G (d). The effective core potentials with a B3LYP/LanL2DZ basis set were used for Ir atoms. Both ground and excited state calculations were performed for all molecules. The excitation behaviors of the complexes were computed by time-dependent DFT (TD-DFT) method based on optimized geometries at the ground states. All calculations were carried out by using the Gaussian 09 program.
