## Supporting Information

# Significant enhancement of cathode-ray scintillating for a conductive Bi-SMOF via in situ partial rare earth ion replacement 

Jian Lu, ${ }^{\text {ab }}$ Xiu-Hui Zhao, ${ }^{\text {a }}$ Bing Bai, ${ }^{\text {a Fa-Kun Zheng*a }}$ and Guo-Cong Guo*a<br>${ }^{a}$ State Key Laboratory of Structural Chemistry, Fujian Institute of Research on the Structure of<br>Matter, Chinese Academy of Sciences, Fuzhou, Fujian 350002, P. R. China<br>${ }^{b}$ University of Chinese Academy of Sciences, Beijing, 100049, P. R. China

## Experimental section

All of the chemicals were purchased from commercial sources and were used without further purification. Organic ligand 1,4-naphthalenedicarboxylic acid (1,4- $\mathrm{H}_{2} \mathrm{ndc}$ ) and metal ion salts $\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ and $\mathrm{Ln}\left(\mathrm{NO}_{3}\right)_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ were purchased from Adamas-beta ${ }^{\circledR}$ chemical industrial company. Organic bases imidazole and piperazine were acquired from TCI (Shanghai) chemical industry development Co., LTD. N,N-Dimethylformamide (DMF, 99.9\%) and ethanol were from Sinopharm Chemical Reagent Co., Ltd. Ultrapure water was self-prepared and used throughout all experiments.

## Synthesis of Bi-SMOF (1)

Compound 1 was synthesized through solvothermal reactions. $\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3} \cdot 5 \mathrm{H}_{2} \mathrm{O}(73 \mathrm{mg}, 0.15$ mmol ), $1,4-\mathrm{H}_{2} \mathrm{ndc}$ ( $216 \mathrm{mg}, 1 \mathrm{mmol}$ ), and organic base (piperazine or imidazole, 0.15 mmol ) were mixed and dissolved in DMF ( 4 mL ) after vigorously stirring for 40 min . The resulting pale clear solution was transferred into a 25 mL Teflon-lined stainless vessel under autogenous pressure, then heated to $90^{\circ} \mathrm{C}$ for 3 d and naturally cooled to room temperature. Block crystals of 1 were separated by filtration, washed by DMF and dried in air. Yield: 108 mg ( $86 \%$ based on $\left.\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3} \cdot 5 \mathrm{H}_{2} \mathrm{O}\right)$. The $\mathrm{Hdma}^{+}$cations are generated via the decomposition of DMF. ${ }^{1-4}$ Elemental analysis calcd) of $\mathrm{C}_{32} \mathrm{H}_{34} \mathrm{BiN}_{3} \mathrm{O}_{10}$ : C 46.33, H 4.13, N $5.07 \%$, and found: $\mathrm{C} 45.87, \mathrm{H} 4.08, \mathrm{~N}$ 5.22\%. Selected FT-IR ( $\mathrm{cm}^{-1}$ ): 3047(m), 2965(w), 2926(w), 2789(m), 2486(w), 1656(s), 1590(s), 1557(s), 1514(s), 1461(s), 1400(s), 1368(s), 1260(s), 1202(s), 1156(m), 1103(s), 1060(w), 1025(m), 975(w), 921(m), 873(m), 836(s), 788(s), 665(s), 613(w), 574(s), 514(w) and $464(\mathrm{~m})$ (Fig. S4). IR bands at 1656 and $464 \mathrm{~cm}^{-1}$ are assigned to the carboxylate group and metalcarboxylate bond, respectively, providing information on the deprotonated ligand $1,4-$ ndc $^{2-}$ and successful synthesis of $\mathbf{1}$.

## In situ doping minor RE $^{3+}$ cations in Bi-SMOF $1\left(\mathbf{R E}^{3+}=\mathbf{E u}^{3+}, \mathbf{T b}^{3+}\right.$, Sm $^{3+}$ and Dy ${ }^{3+}$ )

The reaction process of $\mathrm{RE}^{3+}$ ions-doped $\mathbf{1 a - 1 d}$ is the same as that of Bi-SMOF 1, except that the initial reactant metal sources were replaced by the mixture of $\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3} \cdot 5 \mathrm{H}_{2} \mathrm{O}(0.14625$ mmol, $97.5 \mathrm{~mol}-\%)$ and dopant $\mathrm{Ln}\left(\mathrm{NO}_{3}\right)_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(0.00375 \mathrm{mmol}, 2.5 \mathrm{~mol}-\%)$. After vigorously stirring for 40 minutes, the resulting pale clear solution was transferred into a 25 mL Teflon-lined stainless vessel under autogenous pressure, then heated to $90^{\circ} \mathrm{C}$ for 3 days and naturally cooled to room temperature. The ICP-OES results of the mass ratio / molar ratio of $\mathrm{Bi}^{3+}$ and $\mathrm{RE}^{3+}$ are listed in Table S4.

## X-ray crystallography

Single-crystal X-ray diffractions of $\mathbf{1}$ was performed by a Rigaku PILATUS CCD diffractometer equipped with graphite-monochromated Mo $K_{\alpha}$ radiation $(\lambda=0.71073 \AA)$ at 293 K . The intensity data sets were collected using a $\omega$-scan technique and reduced using CrysAlisPro software. The structures were solved by direct methods, and the subsequent successive difference Fourier syntheses yielded other nonhydrogen atoms. All atoms except hydrogen atoms were performed through the anisotropic refinement. The hydrogen atoms were calculated in the idealized positions and refined with riding coordinates on their parent atoms. The final structures were refined using a full-matrix least-squares refinement on $F^{2}$ with the Olex2 1.2 program. ${ }^{5-7}$ The coordinated DMF molecule was refined by split process based on the actual situation. Pertinent crystal data and structure refinements are summarized in Table S1. The selected bond lengths and angles are listed in Tables S2. Hydrogen bond information is given in Table S3.

## Physical characterization

Powder X-ray diffraction patterns (PXRD) were recorded with a Miniflex 600 at $40 \mathrm{kV}, 40 \mathrm{~mA}$ for $\mathrm{Cu}-\mathrm{K} \alpha$ with a scan speed of 0.10 s per step and a step size of $0.02^{\circ}$, the data were collected within $2 \theta$ range of 5-60 ${ }^{\circ}$. The Mercury Version 4.1.0 software (https://www.ccdc.cam.ac.uk/support-and-resources/Downloads/\#8a6058f8-d386-e511-91c5005056868fc8 ce657cfc-4cbd-e611-807a-005056868fc8 collapse) was utilized to achieve simulated PXRD patterns dependent on the X-ray crystallographic structure. Fourier transform
infrared spectra (FT-IR) were measured with KBr slices from 4000 to $400 \mathrm{~cm}^{-1}$ using a VERTEX70 infrared spectrum radiometer. Solid state UV-visible diffuse reflectance spectrum was taken by PerkinElmer Lambda 365, while the absorption spectra were conducted under dilute solution state by Shimadzu UV2600 spectrophotometer. Thermogravimetric analysis (TGA) was measured using a METTLER TOLEDO system at a heating rate of $10 \mathrm{~K} \mathrm{~min}^{-1}$ under nitrogen atmosphere. Inductively Coupled Plasma Optical Emission Spectra (ICP-OES) were recorded on Ultima 2 with the limit of detection of 0.5 ppb .

## Luminescent measurements

The photoluminescence spectra were recorded on an Edinburgh FL920 phosphorimeter using a 450W Xenon lamp as excitation source. Luminescence lifetime measurements are carried out on an Edinburgh FLS920 phosphorimeter using a nanosecond pulse lamp as excitation source. The quantitative value of lifetime is calculated by exponential decay fitting.

## Scintillating measurements

The cathode-ray stimulated luminescence (CL) spectra were recorded on a SEM equipped with a Gatan MonoCL3+ cathodoluminescence spectrometer and collected data was processed with the Gatan Digital Micrograph CL software. The spectra were collected using a beam of 0.9 nA and an accelerating voltage of 20 kV . The samples were aligned using the SEM to image the sample at a magnification of $100 \mathrm{X}-500 \mathrm{X}$ for a moderate view, and were arranged at a working distance of 12.354 nm . Spectra were obtained using 0.3 nm slit widths with collecting range from 200-800 nm .

## Electrochemical measurements

The electrochemical properties of target $\mathbf{1 , 1 a}$ and $\mathbf{1 c}$ were evaluated in a common threeelectrode cell using chronoamperometry (CA) techniques. The current densities in the present study were all obtained at -1.7 V vs $\mathrm{Hg} / \mathrm{HgCl}_{2}$. All electrochemical experiments were carried out at room temperature, and all solutions were deaerated by purging with high purity Ar for 10 min
before measurements.

## Calculation of electronic structures and density of states (DOS)

The calculation models were built directly from X-ray crystallographic data to calculate the energy band structures. Calculations of the electronic structures and DOS were carried out by the CASTEP code based on DFT with GGA-PBE functional in the Materials Studio v7.0 software package. ${ }^{8}$ Energy cutoff was determined to be 750 eV , and numerical integration of Brillouin zone was employed by $2 * 2 * 1$ monkhorst-Pack $\square$-point.
