Experimental details for GC

Separation and quantification of the reaction components was done on a **GC/FID Clarus 500 GC with autosampler**. Temperature program: 100°C for 3 min, heating to 300°C with 5°C/min, isotherm for 5 min Carrier gas: Nitrogen at a flow of 0.4 mL·min⁻¹; Split ratio 20:1. column: Varian CP-SIL 8CB, 15 m · 0.25 mm, Df= 1 μm. Validation process of the GC-FID method was performed according standard procedures and EURACHEM guidelines.¹ The methods were validated in terms of limit of detection (LOD), limit of quantitation (LOQ), linearity, precision and trueness.
