Oliver Kaufhold, Andreas Stasch, Peter G. Edwards, und F. Ekkehardt Hahn

General: All preparations were carried out under an argon atmosphere using conventional Schlenk techniques. Solvents were dried and degassed by standard methods prior to use. The preparation of 1,2-bis(phosphino)benzene,¹ 1,2-bis(dichlorophosphino)benzene **2**,² and (β -triphenylphosphinimine)ethylenamine **4**³ have been described. *o*-bromofluorobenzene was degassed and dried over a molecular sieve. All other chemicals were used as received. NMR spectra were recorded with a Bruker Avance I 400 NMR spectrometer. IR spectra were measured with a Bruker Vector 22 spectrometer. Electrospray mass spectra were obtained with a Daltronics Micro TOF spectrometer.

Synthesis of **2:** Compound **2** was prepared using a modified protocol of the synthesis reported by Kyba.¹ A solution of triphosgene (15.0 g, 50.5 mmol) in CH₂Cl₂ (150 mL) was treated dropwise with a solution of 1,2-bis(phosphino)benzene (3.2 g, 22.5 mmol) in CH₂Cl₂ (50 mL) at -78 °C. The reaction mixture was allowed to warm up to ambient temperature and was stirred at this temperature for 3 d. Compound **2** was obtained as colorless liquid after distillation in vacuo. Yield: 2.8 g (10.0 mmol, 44 %). The ¹H NMR data match those reported.¹ ¹³C{¹H} NMR (100.6 MHz, CDCl₃): δ 144.6 (d, ¹J_{PC} = 13 Hz, Ar-C_{ipso}), 133.8 (Ar-C_{meta}), 131.1 (d, ²J_{PC} = 9 Hz, Ar-C_{ortho}); ³¹P{¹H} NMR (162.0 MHz, CDCl₃): δ 151.

Synthesis of **3:** The reaction has to be carried out at -78 °C. The reactants have to be cooled to this temperature prior to use. A solution of *n*-butyllithium (22.1 mL of a 2.5 M solution, 55.3 mmol) in diethyl ether (100 mL) was treated dropwise with a solution of *o*-bromofluorobenzene (6.3 mL, 57.8 mmol) in diethyl ether (20 mL). After 15 min, a solution of **2** (3.8 g, 12.8 mmol) in diethyl ether (20 mL) was added to the reaction mixture. The

resulting mixture was stirred for 4 h at $-78\text{ }^\circ\text{C}$ and then for 12 h at ambient temperature. Aqueous ammonium chloride (150 mL) was added and the mixture was extracted with diethyl ether (4×250 mL). The solvent of the combined organic phase was removed in vacuo and the residue was dissolved in hot methanol. Compound **3** was isolated by filtration after cooling to $-35\text{ }^\circ\text{C}$. The crude product was again dissolved in dichloromethane (10 mL) and purified by passing down a short (2 cm) SiO_2 column. After removal of the solvent compound **3** was isolated as a colourless solid.
