A. General method

¹H and ¹³C NMR spectra were recorded on BRUKER DRX-400 spectrometer using CDCl₃ as solvent and TMS as an internal standard. Chemical shifts are reported relative to CDCl₃ (¹H NMR 7.27; ¹³C NMR 77.0). IR spectra were obtained as potassium bromide pellets or as liquid films between two potassium bromide pellets. High-resolution mass spectra (ESI TOF (+)) were measured on ThermoFisher Scientific LTQ Orbitrap XL.

C. General procedure for substrate **2a-2m**

A mixture of 1,3-diphenylprop-2-yn-1-one (1mmol), PdCl₂(10 mol %), FeCl₂ (5 mol %), LiCl (2 equiv) in xylene (3 mL) was added into a schlenk tube. The tube was then put into a 80 °C oil bath under magnetic stirring for 24 h under the atmosphere of N₂ (1atm). After the reaction was finished, the reaction mixture was cooled to room temperature, and extracted the crude product with ethyl acetate. The organic extract was concentrated in vacuum, and the resulting residue was purified by silica gel column chromatography using light petroleum ether/ethyl acetate as eluent to afford the desired products, which were further recrystallized from EtOAc/EtOH.
