## Detailed experimental procedures

**General Experimental Procedures.** Optical rotation was measured at 15°C using a Jasco P-1020 polarimeter equipped with a 1 dm pathlength cell. IR spectrum was obtained over the frequency range of 399.3-3996.3 cm<sup>-1</sup> using a Tensor 27 spectrometer with KBr pellets. UV spectrum was recorded using a Shimadzu UV-2401A spectrophotometer equipped with a DAD and a 1 cm pathlength cell. Samples in methanol solution (0.032mg/ml) were scanned from 190-400 nm in 1 nm steps. ECD spectrum was recorded using an Applied Photophysics Chirascan spectrometer equipped with a 1 cm pathlength cell. Samples in methanol solution (0.32mg/ml) were scanned from 195-400 nm in 1 nm steps. 1D and 2D NMR spectra were performed on a Bruker DRX-500 spectrometer with TMS as an internal standard. Mass spectra were obtained on a Bruker Esquire HCT 3D ion trap mass spectrometer (ESI mode) and an API-Qstar-Pulsar instrument (HRESI mode). Column chromatography (CC) was performed using silica gel (200–300 mesh, Qingdao Marine Chemical Co. Ltd., Qingdao, People’s Republic of China) and MCI gel (75–150 µm; Mitsubishi Chemical Corporation, Japan).

**Computational Methods.** The theoretical <sup>13</sup>C NMR and ECD spectra were performed by density functional theory (DFT) and time-dependent DFT (TD-DFT), respectively, using Gaussian 09<sup>1</sup> and analyzed using GUIs *GaussView* (version 5.0). A conformational search using molecular mechanics calculations was performed in Discovery Studio 3.1 Client.<sup>2</sup> The corresponding minimum geometries were fully optimized by DFT at the B3LYP/6-31G(d) level, followed then optimized at the

B3LYP/6-31+G(d, p) level of theory in three systems (the gas phase, methanol, and pyridine). Frequency calculations (at 298.15 K) at the same level of theory were used to confirm the nature of all stationary points as minima and also provided values for computed free energies.<sup>3</sup> Boltzmann statistics based on relative free energies at 298.15 K was used in the computations.<sup>4</sup> The relative energies, relative free energies in three systems (the gas phase, methanol, and pyridine), together with their Boltzmann-calculated distributions are given in Table S1.

The <sup>13</sup>C NMR shielding constants were computed using GIAO technique at the mPW1PW91-SCRF/6-311+G(2d,p) level of theory in PCM solvent continuum model with pyridine as a solvent.<sup>5</sup> The <sup>13</sup>C NMR chemical shifts were calculated as  $\delta = \sigma_{\text{ref}} - \sigma$ , where  $\sigma_{\text{ref}}$  was the shielding constant of TMS calculated at the same level of theory (187.1160 ppm).<sup>6</sup> Calibration of the <sup>13</sup>C NMR chemical shifts was effected by plotting experimental values against calculated values and performing linear regression analysis. The resulting equation was then used for calibrating the calculated <sup>13</sup>C NMR chemical shifts (see Figure S19).<sup>6</sup>

Time-dependent DFT (TD-DFT) with the basis set B3LYP/6-31+G(d,p) was used to calculate the excitation energies ( $E$ ), oscillator strength ( $f$ ), rotatory strength in velocity form ( $R_{\text{vel}}$ ) and rotatory strength in length form ( $R_{\text{len}}$ ) of the lowest 30 excited states.<sup>7</sup> The calculations were performed in the gas phase and in methanol using the COSMO solvent continuum model. The peak intensity,  $\Delta\epsilon(E)$ , was calculated with the Gaussian function:

$$\Delta\epsilon(E) = \frac{1}{2.297 \times 10^{-39}} \frac{1}{\sqrt{2\pi\sigma}} \sum_i^A \Delta E_i R_i e^{-[(E - \Delta E_i)/(2\sigma)]^2}$$

where  $\sigma$  is the width of the band at  $1/e$  height and  $\Delta E_i$  and  $R_i$  are the excitation energies and rotatory strengths for transition  $i$ , respectively,  $\sigma = 0.20$  eV and  $R_{\text{vel}}$  were used.<sup>7</sup>

**Extraction and Isolation.** The whole plant of *P. cernua* was collected in Guizhou Province, People's Republic of China, and was identified by one of the authors (X. C) (voucher no. 201105P). The air-dried and powdered sample (60 kg) was extracted with pure MeOH for three times (4, 3, and 3 h). The extracts were partitioned between EtOAc and 1% HCl/H<sub>2</sub>O. The water-soluble portion was adjusted to pH 9 with saturated aqueous Na<sub>2</sub>CO<sub>3</sub> solution, and then was extracted with CHCl<sub>3</sub> to afford an alkaloidal extract (51.5 g). The latter was chromatographed on MPLC (MCI gel) eluting with a gradient of MeOH–H<sub>2</sub>O (3:7, 6:4, 8:2, and 1:0) to give four fractions (F01–F04). F01 (6 g) and F02 (12 g) were submitted to repeated silica gel CC to yield lycopalhine A (**1**, 1.5 mg), and a known compound obscurinine (**2**, 10 mg)<sup>8</sup>, respectively.

**Lycopalhine A (1):** colorless gum;  $[\alpha]_D^{15} + 89.1$  (c 0.17, CH<sub>3</sub>OH); UV (CH<sub>3</sub>OH)  $\lambda_{\text{max}}$  (log  $\varepsilon$ ) 203 (2.61) nm; IR (KBr)  $\nu_{\text{max}}$  3431, 2921, 1716, 1631, 1417, 1261, 1097, 1026, 802, 581 cm<sup>-1</sup>; <sup>1</sup>H and <sup>13</sup>C NMR data, see Table 1; positive ESIMS  $m/z$  289 [M + H]<sup>+</sup>; positive HRESIMS  $m/z$  2891920 [M + H]<sup>+</sup> (calcd for C<sub>17</sub>H<sub>25</sub>N<sub>2</sub>O<sub>2</sub>, 289.1916).

### Acetylcholinesterase (AChE)/Butrylcholinesterase(BuChE) Inhibitory Activity

**Assay.** AChE/BuChE inhibitory activity of the compounds isolated was assayed by the spectrophotometric method developed by Ellman et.al with slightly modification.<sup>9</sup>

S-acetylthiocholine iodide, S-butyrylthiocholine iodide,  
5,5'-dithio-bis-(2-nitrobenzoic) acid (DTNB, Ellman's reagent), AChE and BuChE  
derived from human erythrocytes were purchased from Sigma Chemical Company.  
Compounds were dissolved in DMSO. The reaction mixture contained 110  $\mu$ L of  
phosphate buffer (pH 8.0), 10  $\mu$ L of test compound (50  $\mu$ M), and 40  $\mu$ L of AChE or  
BuChE (0.04 U/100  $\mu$ L), and the mixture was incubated for 20 min (30 °C). The  
reaction was initiated by the addition of 20  $\mu$ L of DTNB (6.25 mM) and 20  $\mu$ L of  
acetylthiocholine or butyrylthiocholine for AChE or BuChE inhibitory activity,  
respectively. The hydrolysis of acetylthiocholine or butyrylthiocholine was monitored  
at 405 nm after 30 min. Tacrine was used as positive control. All the reactions were  
performed in triplicate. The percentage inhibition was calculated as follows: %  
inhibition =  $(E - S)/E \times 100$  (E is the activity of the enzyme without test compound  
and S is the activity of enzyme with test compound).
