**General.** All reactions that required anhydrous conditions were carried by standard procedures under nitrogen atmosphere. Commercially available reagents were used as received. The solvents were dried by distillation over the appropriate drying reagents. Infrared spectra were recorded on a TENSOR 27 FT-IR spectrophotometer and reported in wave numbers ( $\text{cm}^{-1}$ ).  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded on Varian (400 MHz) spectrometer. Chemical shifts ( $\delta$ ) are reported in ppm relative to TMS ( $\delta$  0.00) for the  $^1\text{H}$  NMR and to chloroform ( $\delta$  77.0) for the  $^{13}\text{C}$  NMR measurements. High resolution mass spectra were obtained on a UltiMate 3000 spectrometer. Enantiomeric excesses were determined by HPLC analysis on Dionex UltiMate 3000 HPLC units, including the following instruments: pump, LPG-3400SD; detector, VWD-3100; column, Daicel Chiralpak IA, IB or IC. Optical rotations were recorded on a Jasco DIP-1000 polarimeter. Reactions were followed with TLC (0.254mm silica gel 60-F plates). Visualization was accomplished with UV light. Flash chromatography separations were performed on 200-300 mesh silica gel.

### General Procedure for the Bromoamination and Silylation of Allylic Alcohols.

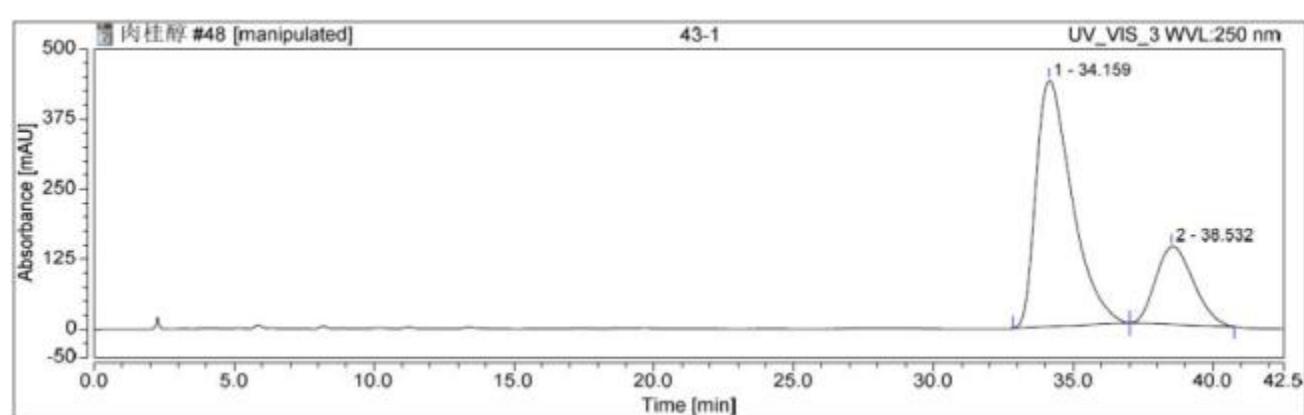

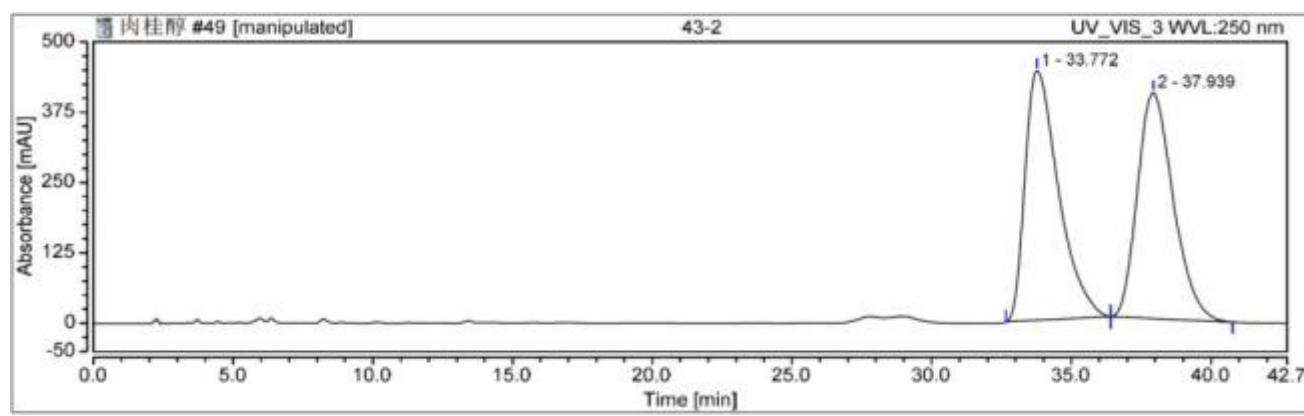

To a solution of allylic alcohol **1** (0.20 mmol, 1.00 equiv), catalyst **4s** (14.0 mg, 0.02 mmol, 0.10 equiv) in  $\text{CH}_2\text{Cl}_2$ /toluene (2:3, 5.0 mL) at  $-35$  °C in dark under  $\text{N}_2$  was added *NN*-dibromo-4-nitrobenzenesulfonamide (86.4 mg, 0.24 mmol, 1.20 equiv). The resulting mixture was stirred at  $-35$  °C for 120 h. The reaction was quenched with saturated  $\text{Na}_2\text{SO}_3$  (3.0 mL) at  $-35$  °C and then was warmed to 25 °C. The solution was diluted with water (3.0 mL) and extracted with  $\text{CH}_2\text{Cl}_2$  ( $3 \times 6$  mL). The combined extracts were washed with brine (10.0 mL), dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated *in vacuo*. The residue was purified by a short silica column to give a mixture of **2** and  $\text{NsNH}_2$ . To a solution of the mixture in  $\text{CH}_2\text{Cl}_2$  (2.0 mL) was added TBSCl (33.2 mg, 0.22 mmol) and imidazole (15.0 mg, 0.20 mmol) at 25 °C. The resulting mixture was stirred at 25 °C for 2 h, to the mixture was added brine (3 mL) and extracted with  $\text{CH}_2\text{Cl}_2$  ( $3 \times 5$  mL). The combined extracts were dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated *in vacuo*. The residue was purified by flash column chromatography to yield the corresponding vicinal bromoamine **3**.

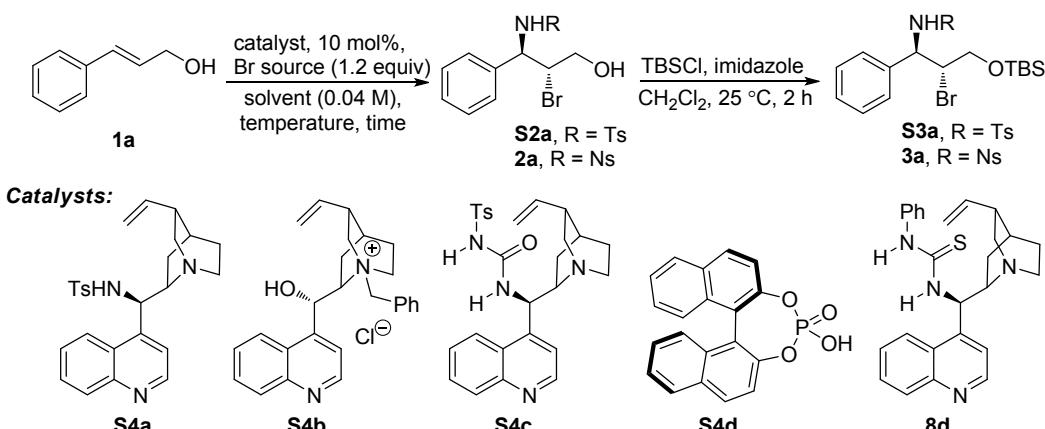

**Scheme S1. Silylation of **2a**.**

Treatment of **2a** according to the general procedure (step 2) resulted in **3a** in 96% yield without change of enantiopurity. HPLC of **2a** (Daicel Chiralpak IC, *i*-PrOH/hexane = 10/90, 1.5 mL/min, 250 nm)  $t_1$  = 34.2 min (major),  $t_2$  = 38.5 min (minor):

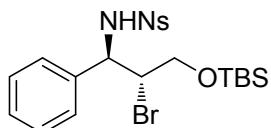

**Table S1. Optimization of the Bromoamination of **1a**.**
