## 2.- External and Internal mass transfer

To determine if the external mass transfer resistance was significant, the modified Mear's criterion ( $C_M$ ) was used (Eq. S1)

$$\frac{\langle r \rangle_{A_c} n}{k_c \langle C_b \rangle_V} < 0.1 \quad \text{S1}$$

Where:

$$\langle r \rangle_{A_c} = \frac{Q (C_{out} - C_{in})}{m_c BET}$$

The influences of internal mass transfer were assessed by using the Weisz-Prater Criterion modified (Eq. S2).

$$\frac{\langle r \rangle_{A_c} r_{eq}^2}{D_{eff} C_s} < 1 \quad \text{S2}$$

where:

$\langle r \rangle_{A_c}$ : average reaction rate ( $\text{mol m}^{-2} \text{s}^{-1}$ )

$n$ : reaction order (assumed to be 1 for acetaldehyde)

$k_c$ : mass transfer coefficient ( $\text{m s}^{-1}$ )

$\langle C_b \rangle_V$ : bulk average concentration ( $\text{mol m}^{-3}$ )

$Q$ : volumetric flow rate ( $\text{m}^3 \text{s}^{-1}$ )

$C_{out}$ : outlet concentration ( $\text{mol m}^{-3}$ )

$C_{in}$ : inlet concentration ( $\text{mol m}^{-3}$ )

$m_c$ : mass (g)

BET: BET surface area ( $\text{m}^2 \text{g}^{-1}$ )

$r_{eq}$ : equivalent radius (m)

$C_s$ : film superficial concentration ( $\text{mol m}^{-3}$ )

All experiments used to obtain the kinetic parameter satisfy the  $C_M/C_{WP}$  criteria. Note that, for the reaction under UV irradiation it was necessary to use irradiation levels lower than 25 %.
