S1 Gas concentration approximation

- Maximum limit based on the assumption that the liquid drop was fully evaporated

We can approximate the amount of the vapor due to vapor pressure based on the equation expressed in previous question.

$$n_{VOC} = \frac{P_{VOC} V_{Total}}{RT}$$

From the evaporated amount from 5 μ l each reagent drops, we can finally approximate the concentration when it will be fully evaporated.

$$C_{VOC,max}[ppmv] = \frac{\frac{P_{VOC}}{P_{atm}} \times 10^6 \times V_{total\ reagent}}{n_{VOC} \times \frac{Molar\ mass}{Density}} = \frac{RT \times 10^6 \times V_{total\ reagent}}{V_{Total} \times \frac{Molar\ mass}{Density}}$$

VOC	Amount (mole)	Density (g/ml)	Molar mass (g/mol)	$C_{VOC,max}$ [ppmv]
Linalool	1.08×10^{-6}	0.86	154.25	5683
Cis-3-hexen-1-ol	5.89×10^{-6}	0.846	100.159	8610
Cis-3-hexenyl-acetate	7.85×10^{-6}	0.897	142.198	6430
Methyl salicylate	2.2×10^{-7}	1.174	152.149	7865

Table S 1. Maximum concentration limit for each VOC

- Approximation of mixture concentration

$$\text{Concentration} = \text{Volume percent ratio} \times \text{Density}_{Mixture} \times 10^6 \quad (\frac{mg}{L} = \frac{\mu g}{ml})$$

$$\text{Density}_{Mixture} = \frac{\text{Density}_{Linalool} + \text{Density}_{Cis - 3 - hexen - 1 - ol} + \text{Density}_{Methyl\ salicylate}}{3}$$
