Turnover frequency for an electrocatalytic water splitting reactions can be evaluated by different means, in our case we have chosen the method of using OER current at specific over voltage and the surface concentration of catalyst atoms at the modified Nickel foam working electrode which was calculated from the amount of the catalyst we added to modify the working electrode. The corresponding expression as:

$$\text{TOF} = i \times \text{NA} / \text{A} \times \text{F} \times n \times \text{r}$$

Where, i = current NA= Avogadro number A = Geometrical surface area of the electrode

F = Faraday constant n = Number of electrons r = Surface concentration. We have taken the

OER current observed at 1.50 V (vs. RHE) and calculated the TOF to be 0.07 s^{-1} , 0.78 s^{-1} , 11.7 s^{-1} for $\beta\text{-Co(OH)}_2/\text{NF}$, $\alpha\text{-Co(OH)}_2/\text{NF}$, and $\alpha\text{-CoNiOOH}/\text{NF}$, respectively shown in Figure S7.

Furthermore, electrical double layer capacitance (EDLC) was used to evaluate the capacitive behavior of the synthesized electrocatalysts for practical applications. Furthermore, Figure S8 a, c & e illustrates the cyclic voltammograms for $\alpha\text{-CoNiOOH}/\text{NF}$, $\alpha\text{-Co(OH)}_2/\text{NF}$, and $\beta\text{-Co(OH)}_2/\text{NF}$, respectively at various scan rates from (100-500 mVs^{-1}) in the non-faradaic region between 0.9-1.0 V (vs RHE). A rectangular behavior was observed for all the synthesized catalysts, which confirms the existence of a double layer. Furthermore, a linear increase in both the anodic (i_a) and cathodic (i_c) current densities was observed with increase in scan rate. The capacitance of $\alpha\text{-CoNiOOH}/\text{NF}$ is 7.76 mFcm^{-2} which is higher than the capacitance for $\alpha\text{-Co(OH)}_2/\text{NF}$ i.e. 5.72 mFcm^{-2} , which is analogous with the other results.

Table S1. BET surface area and pore volume of α -Co(OH)₂, β -Co(OH)₂, and α -CoNiOOH

Material	BET Surface Area m²/g	Langmuir Surface Area m²/g	BJH Pore Volume (cm³/g)	BET Pore Size (Å)
β -Co(OH) ₂	40.62	272.90	0.16	88.33
α -Co(OH) ₂	87.78	292.01	0.28	56.78
α -CoNiOOH	134.29	772.39	0.30	43.40

Table S2. A comparison of OER catalysts at 10 mA cm⁻²

Catalyst	η^{10} (mV)	Electrolyte	Ref
α -Co ₂ NiOOH	190	1M KOH	This Work
CoZn LDH	470	0.1M KOH	[1]
CoMn LDH	293	1M KOH	[2]
CoFe LDH	314	1M KOH	[3]
Fe _{0.1} NiS ₂ NA/Ti	205	1M KOH	[4]
Ni _{2.3%} CoS ₂ /CC	297	1M KOH	[5]
Ag NP/NiRu-LDHs	310	0.1M KOH	[6]

OCoCCuxNiyFe4-x- yN/NF	121	0.1M KOH	[7]
CoFe/NF	220	1M KOH	[8]
Co-Ni ₃ N	307	1M KOH	[9]
CcNiFeMo	238	1M KOH	[10]
Ni _{0.75} Fe _{0.125} V _{0.125} - LDHs/ NF	231	1M KOH	[11]
CoFePO	274.5	1M KOH	[12]
