**Figure S1** Schematic illustration of the preparation process of DNA incorporated agarose hydrogel and hydrogel-based analysis.

**Figure S2** Manual analysis process by ImageJ software.

**Figure S3** Feasibility of the fluorescent detection of K<sup>+</sup>. (A) Fluorescence spectra of 100 mM Tris-HCl buffer solutions containing different reagents: NMM, NMM + DNA probe, and NMM + DNA probe + K<sup>+</sup>, respectively (left part). And corresponding photographic images under UV light (right part). The concentration of NMM, DNA probe, and K<sup>+</sup> were 50 μM, 1.5 μM, and 0.25 mM, respectively. (B) Selectivity verification of K<sup>+</sup> detection. (C) Fluorescence spectra in the detection of different concentrations of K<sup>+</sup>. (D) Linear relationship of the fluorescence intensity at 620 nm and the concentration of K<sup>+</sup>. The inset shows the fluorescence intensity in the presence of different concentrations of K<sup>+</sup>.

**Figure S4** The stability of fluorescence signal of the reaction solution. 5 mM K<sup>+</sup>, 1.5 μM DNA probe, and 50 μM NMM were reacted in 100 mM Tri-HCl (pH = 7.4) at 25 °C for 120 min.

**Figure S5** Effect of the concentration of agar on the fluorescence intensity. 5 mM  $K^+$ , 2  $\mu\text{M}$  DNA probe, and 50  $\mu\text{M}$  NMM were reacted in 100 mM Tri-HCl at 25  $^\circ\text{C}$  for 120 min.

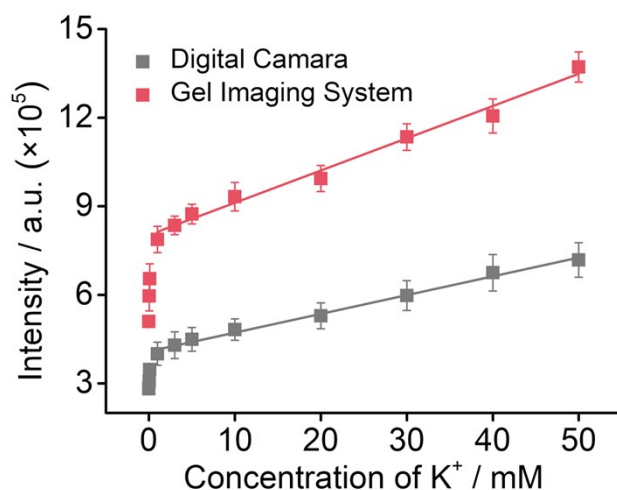

**Figure S6** Effect of the concentration of buffer solution on the fluorescence intensity. 5 mM  $K^+$ , 2  $\mu\text{M}$  DNA probe, and 50  $\mu\text{M}$  NMM were reacted at 25  $^\circ\text{C}$  for 90 min.

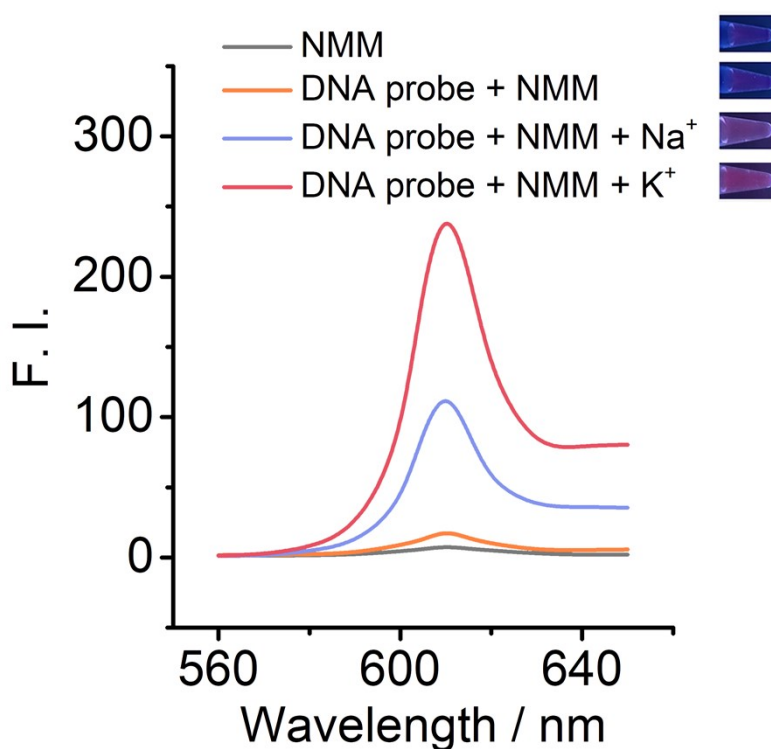

**Figure S7** Effect of the pH values of buffer solution on the fluorescence intensity. 5 mM  $K^+$ , 2  $\mu$ M DNA probe, and 50  $\mu$ M NMM were reacted in 200 mM Tri-HCl at 25  $^{\circ}$ C for 90 min.

**Figure S8** Effect of the concentration of DNA probe on the fluorescence intensity. 5 mM  $K^+$  and 50  $\mu$ M NMM were reacted in 200 mM Tri-HCl (pH = 7.4) at 25  $^{\circ}$ C for 90 min.

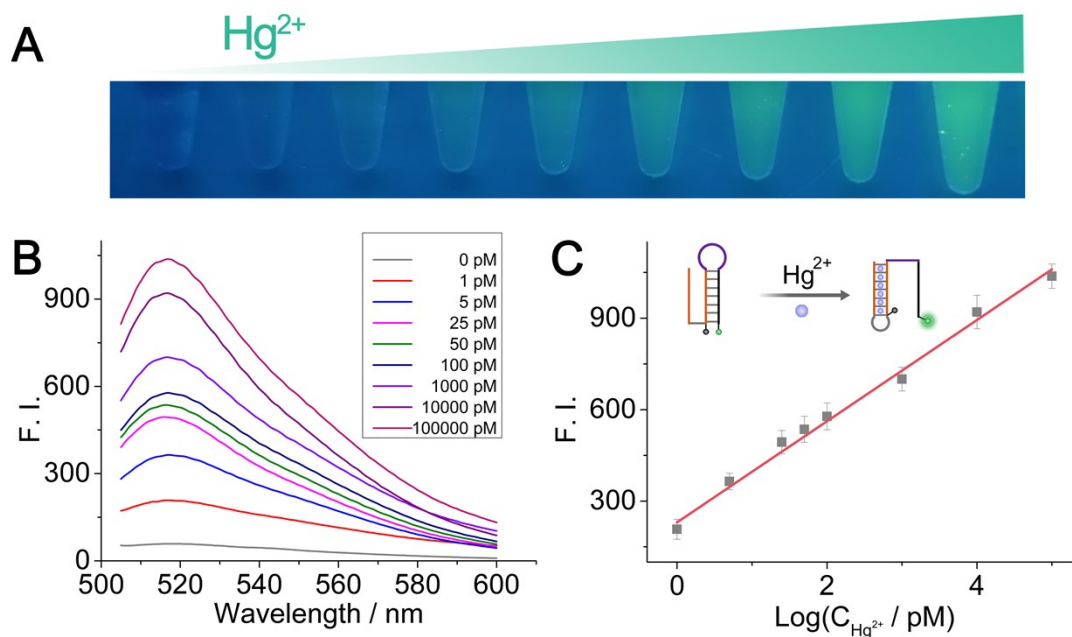

**Figure S9** Linear relationship between the fluorescence intensity and the concentration of K<sup>+</sup>. Data was acquired by manual analysis based on ImageJ software.

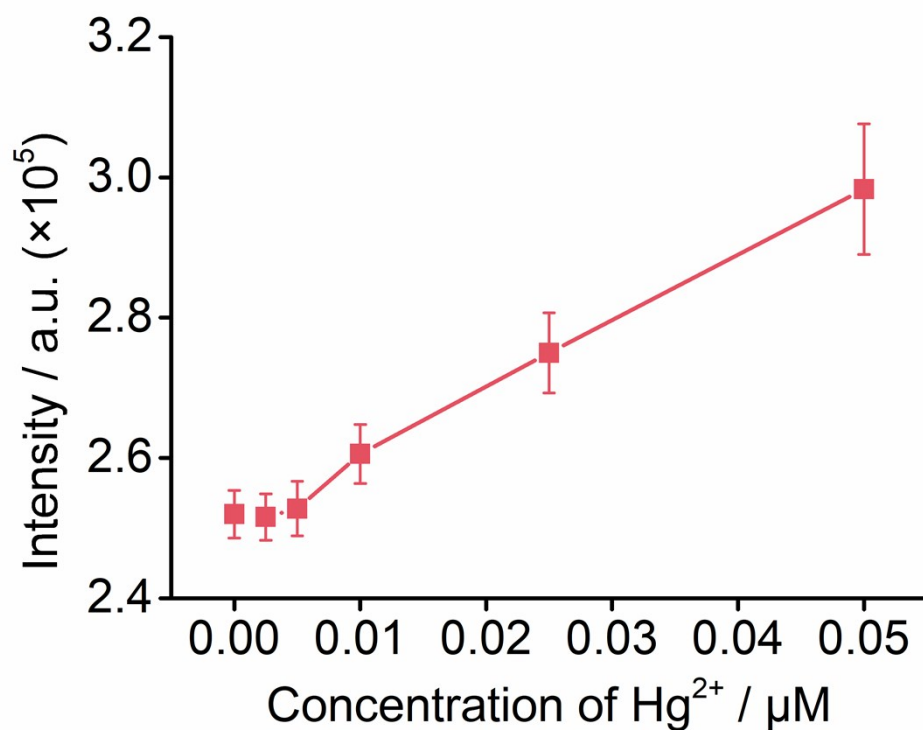

**Figure S10** Comparison of the fluorescent detection of Na<sup>+</sup> and K<sup>+</sup> in solution. (A) Fluorescence spectra of 100 mM Tris-HCl buffer solutions containing different reagents: NMM, NMM + DNA probe, NMM + DNA probe + Na<sup>+</sup>, and NMM + DNA probe + K<sup>+</sup>, respectively (left part), and corresponding photographic images under UV light (right part). The concentration of NMM, DNA probe, Na<sup>+</sup> and K<sup>+</sup> were 50 μM, 1.5 μM, 0.25 mM, and 0.25 mM, respectively.

**Figure S11** Feasibility of the fluorescent detection of  $Hg^{2+}$  based on  $Hg^{2+}$ -sensitive DNA probe. (A) Photographic images of the detection of different concentrations of  $Hg^{2+}$  under UV light. (B) Fluorescence spectra in the detection of different concentrations of  $Hg^{2+}$ . (C) Linear relationship of the fluorescence intensity at 520 nm and the concentration of  $Hg^{2+}$ . The inset shows the allosteric switch of the DNA probe in the presence of  $Hg^{2+}$ .

**Figure S12** Linear relationship between the fluorescence intensity and the concentration of  $Hg^{2+}$ . Data was acquired by manual analysis based on ImageJ software.

**Table S1** The comparison of detection performances of our method and other methods in the detection of  $K^+$ .

Method	Limit of detection	Linear range	Reference
Pyrene-labeled G-quadruplex oligonucleotide	1 mM	2 mM ~ 10 mM	[1]
DNA/aptamer-based optical biosensors	0.4 mM	0.6 mM ~ 20 mM	[2]
G-quadruplex-specific fluorescent probe	0.5 mM	2 mM ~ 20 mM	[3]
DNA hydrogel-based plate	0.34 mM	1 mM ~ 40 mM	This work

**Table S2** The comparison of detection performances of our method and other methods in the detection of  $Hg^{2+}$ .

Method	Limit of detection	Linear range	Reference
Carbon quantum dots/3-aminophenylboronic acid Hybrid	38.1 nM	0.1 $\mu$ M ~ 6.0 $\mu$ M	[4]
Cellulose nanofiber substrate-supported luminescent gold nanoparticles	1 nM	1 nM ~ 1 mM	[5]
Hollow AuAg nanocages	10 nM	30 nM ~ 35 $\mu$ M	[6]
Mercury-stimulated $Ag_3PO_4$ microcubes	20 nM	0.1 $\mu$ M ~ 7 $\mu$ M	[7]
DNA hydrogel-based plate	5.6 nM	10 nM ~ 2.5 $\mu$ M	This work
