1. General Methods.

Unless otherwise stated, all reagents were purchased from commercial suppliers and used without purification. All solvents were obtained from commercial sources and were purified according to standard procedures. TLC was carried out on silica gel plates (HSGF 254), which were visualized with UV light and/or staining with phosphomolybdic acids solution. Purification of reaction products was carried out by column chromatography using silica gel (200-300 mesh). ¹H, ¹³C NMR, and ¹⁹F NMR spectra were recorded on a Varian Mercury-300BB (300 MHz) and a Bruker NMR Spectrometer (400 MHz). All chemical shifts (δ) were given in ppm. Chemical shifts are relative to the resonance of the deuterated solvent as the internal standard (CDCl_3 , δ 7.26 ppm for proton NMR, δ 77.16 ppm for carbon NMR; DMSO , δ 2.50 ppm for proton NMR, δ 39.52 ppm for carbon NMR). Date are presented as follows: chemical shift, integration, multiplicity (s = singlet, d = double, t = triplet, q = quartet, m = multiplet), and coupling constant in hertz. Mass spectra were recorded on a Bruker Agilent 1290 MicrOTOF-Q II instrument. Melting points were measured on a melting points apparatus and were uncorrected. The enantioselectivity value determination was carried out using chiral HPLC (Waters) instrumentation with a Chiracel OD-H column and IC-3 column. Optical rotations were measured on a Shanghai ShenGuang SGW-2 polarimeter at $\lambda = 589$ nm. Optical rotations are reported as follows: $[\alpha]_D^{25}$ ($c = \text{g}/100\text{mL}$, solvent).
