### 1. Difference spectra of pyridine adsorbed on acid sites of $\text{WO}_3/\text{Al}_2\text{O}_3$ catalysts

The acidity of  $\text{WO}_3/\text{Al}_2\text{O}_3$  catalysts with various  $\text{WO}_3$  loadings was investigated by adsorbed pyridine on catalysts surface. The bands at 1540 and 1450  $\text{cm}^{-1}$  were attributed to pyridinium ion on Brønsted acid site and pyridine coordinated to Lewis acid site, respectively. The amount of Brønsted and Lewis acidity were estimated from the area of bands at 1540 and 1450  $\text{cm}^{-1}$  and their integrated molar extinction coefficients; 1.67 and 2.22  $\text{cm} \mu\text{mol}^{-1}$ , respectively.<sup>1</sup>

## 2. Conversion, Yield and Selectivity

$$\text{Conversion (\%)} = \frac{\text{sum of moles of all products}}{\text{sum of moles of reactant and all products}} \times 100$$

$$\text{Yield (\%)} = \frac{\text{moles of specific product}}{\text{sum of moles of reactant and all products}} \times 100$$

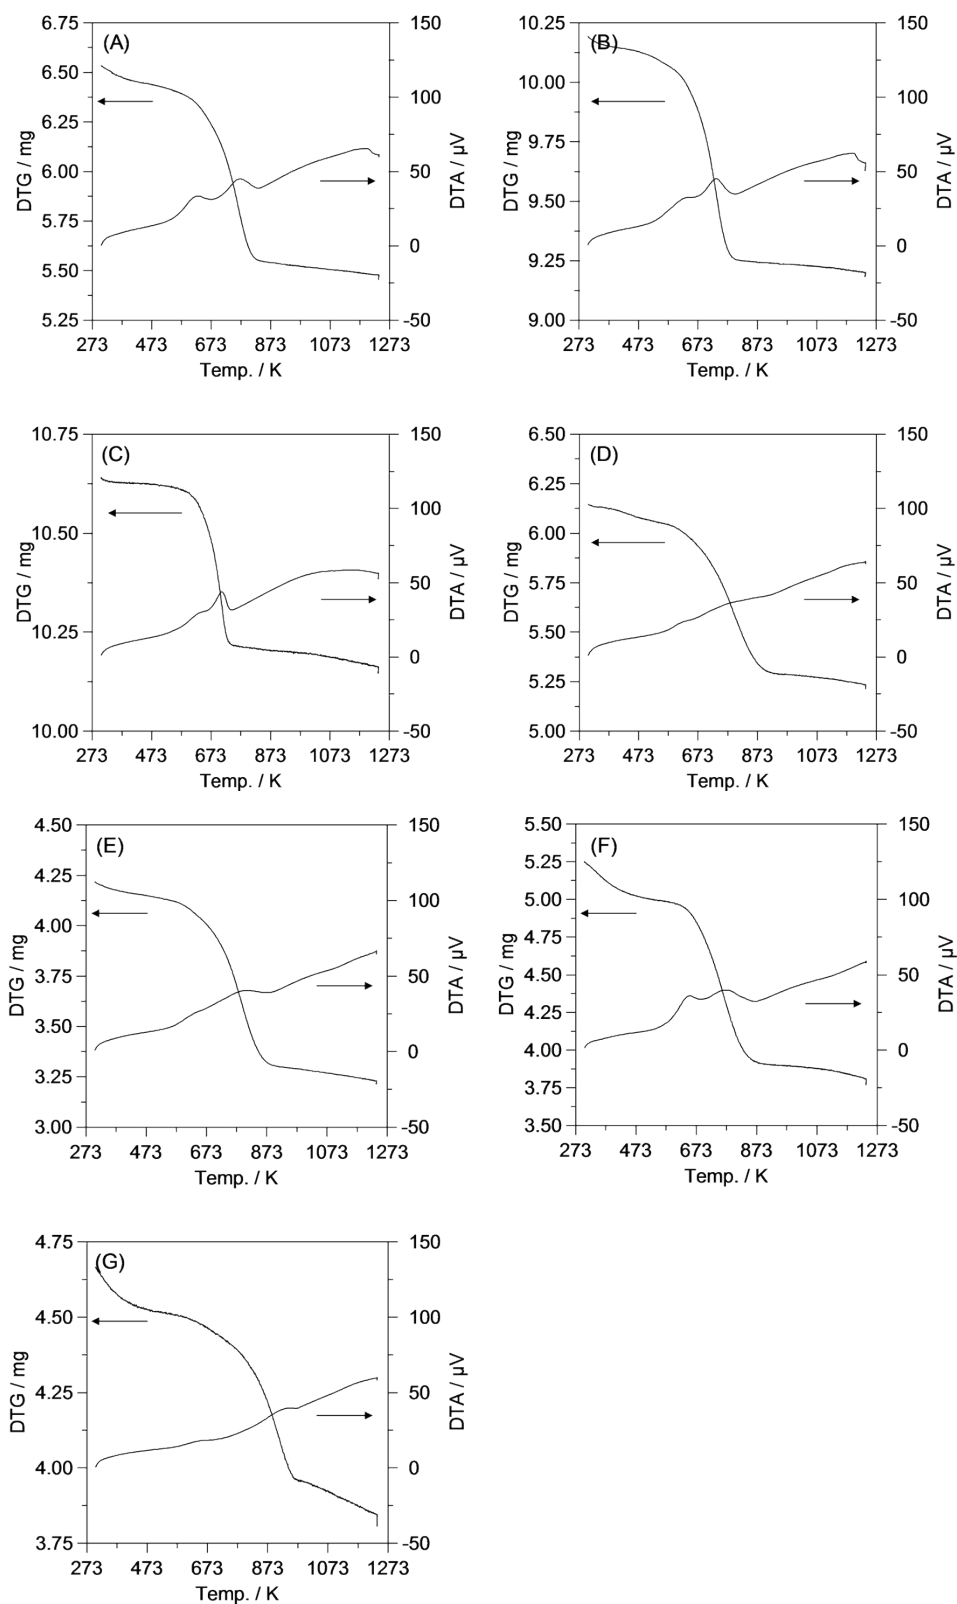

$$\text{Selectivity (\%)} = \frac{\text{moles of carbon in specific product}}{\text{sum of moles of carbon in reactant and all products}} \times 100$$
