## Experimental section

## Optical and electronic measurements

Optical measurements were carried in tetrahydrofuran (THF) solutions with typical material concentrations of $1-4 \times 10^{-5} \mathrm{~mol} \mathrm{~L}^{-1}$. Deoxygenated solutions were prepared in glovebox under Ar atmosphere, using previously degassed solvent, and filled in sealable quartz cuvettes. Films for optical measurements were prepared using spin-coating technique from THF solution with a Laurell WS-400B-6NPP/LITE spincoater on quartz slides, using solutions with material concentration of $5 \mathrm{mg} / \mathrm{mL}$. The UV-Vis spectra were recorded with a Perkin Elmer Lambda 35 spectrometer. Emission spectra, photoluminescence excitation (PLE) spectra, PL lifetimes in THF, low temperature time-resolved spectra in $2-\mathrm{MeTHF}$ and $\Phi_{\mathrm{PL}}$ in films were determined using QuantaMaster 40 steady state spectrofluorometer (Photon Technology International, Inc.) equipped with 6 inch integrating sphere (LabSphere). PLE spectra were measured at the maxima of the corresponding emission bands.

PL decays of the studied compounds in neat films were recorded by the Edinburgh Instruments FLS980 spectrometer exploiting steady-state xenon lamp or pulsed PicoQuant LDH-D-C-375 laser (wavelength 374 nm ) as the excitation source. PL spectra and PL decays in inert atmosphere $\left(\mathrm{N}_{2}\right)$ at different temperatures were recorded using the liquid nitrogen cryostat Optistat DN2. PL decays were fitted using software from Edinburgh Instruments. $\Phi_{\text {PL }}$ temperature dependence was determined by integrating emission intensities and calibrating them with $\Phi_{\mathrm{PL}}$ value measured at room temperature.

Photophysical rate constants for PCbz-1:PMMA (1 wt\%) were calculated using conventional equations used for TADF emitters. ${ }^{1}$ Experimentally obtained quantum yields and decay lifetimes were used for calculations (Table S2). The following equation were used:
$k_{\text {fluor. }}=\frac{\Phi_{\text {prompt }}}{\tau_{\text {prompt }} ;} \Phi_{I S C}=\frac{\Phi_{\text {delayed }}}{\Phi_{\text {delayed }}+\Phi_{\text {prompt }}, \text { where } \Phi_{\text {delayed }} \text { was defined as the quantum }}$ yield sum of the two delayed emission components; $\quad k_{I S C}=\frac{\Phi_{I S C}}{\tau_{\text {prompt }}}$; $k_{\text {RISC }}=\frac{1}{\tau_{\text {delayed }}\left(1-\Phi_{I S C}\right) ;} k_{\text {delayed }}=\frac{\Phi_{\text {delayed }}}{\tau_{\text {delayed }}}$.

Photoemission yield spectroscopy was used to determine ionization potential (IP) and photoconductivity measurements, to determine photoconductivity threshold value $\left(\mathrm{E}_{\mathrm{th}}\right)$. Electron affinity (EA) was then calculated as the difference between IP and $\mathrm{E}_{\mathrm{th}}$. IP and $\mathrm{E}_{\text {th }}$ measurements were carried out on a self-made experimental system, using a procedure described in our previous work. ${ }^{2}$

To estimate hole and electron mobilities of vacuum-deposited layers of the studied compounds, time-of-flight (TOF) method was used. TOF experiments were performed using samples with a structure indium-tin-oxide (ITO) /few $\mu \mathrm{m}$ thick organic layer/aluminium. In TOF setup, a laser (EKSPLA NL300, 355 nm wavelength) was used as the excitation source. To check hole and electron transport in the layers at different electric fields, different positive and negative external voltages (U) were applied to the samples employing $6517 B$ electrometer (Keithley). TDS 3032C oscilloscope (Tektronix) was used to record the photocurrent transients of holes or electrons. Charge mobilities were calculated by the formula $\mu=\mathrm{d}^{2} /\left(U \times \mathrm{t}_{\mathrm{tr}}\right)$, where $\mathrm{t}_{\mathrm{tr}}$ is a transit time, $d$ is the thickness of a layer and $U$ is applied voltage.

## Quantum chemical calculations

For PCP density functional theory (DFT) calculations for geometry optimization, timedependent DFT (TD-DFT) calculations for excited state energies, as well as ISC and fluorescence rate predictions were performed using $O R C A^{3}$ program package (release 4.2.1). Auxiliary tasks were performed in Avogadro program. ${ }^{4}$ For ground state geometry optimization CAM-B3LYP ${ }^{5}$ functional and Def2-TZVP basis were employed. For excited state geometry optimization $\left(\mathrm{S}_{1}\right.$ and $\left.\mathrm{T}_{1}\right)$ analytical gradient calculations were performed using CAM-B3LYP functional and Def2-TZVP/C basis. RIJCOSX approximation was used for TD-DFT. Excited state energies for all geometries were acquired using CAM-B3LYP/ Def2-TZVP theory level. ISC and fluorescence rates were obtained using excited state dynamics (ESD) module. Previously obtained ground state and $\mathrm{S}_{1}$ state geometries and the corresponding Hessians (from analytical frequency calculations) were used as the input for the fluorescence rate calculations. For ISC the input consisted of $\mathrm{S}_{1}$ and $\mathrm{T}_{1}$ geometries and the corresponding Hessians. The contribution of Herzberg-Teller (HT) effect was accounted for ISC. The overall ISC rate was obtained as the sum of three triplet spin-sublevel $(-1,0,1)$ contributions: $1.16 \cdot 10^{8} \mathrm{~s}^{-1}(0)$; $1.62 \cdot 10^{8} \mathrm{~s}^{-1}(-1)$ and $1.62 \cdot 10^{8} \mathrm{~s}^{-1}(1)$.

Calculations for $\operatorname{PCbz}(1-3)$ were performed using Schrödinger (release 2020-2) Jaguar ${ }^{6}$ software package. Geometry optimization and TD-DFT calculations employed MN15 ${ }^{7}$ functional and 6-31G** basis. Conductor-like polarizable continuum model CPCM model for THF was used.

## OLED preparation and characterization

To fabricate devices, materials hexaazatriphenylenehexacarbonitrile (HATCN), N, N'-di(1-naphthyl)-N, $\mathrm{N}^{\prime}$-diphenyl-(1,1'-biphenyl)-4,4'-diamine (NPB), 1,3-bis(9-carbazolyl)benzene (mCP), diphenyl-4-triphenylsilyl-phenylphosphineoxide (TSPO1) and 2,2',2’'-(1,3,5-benzinetriyl)-tris(1-phenyl-1-H-benzimi-dazole) (TPBi) were purchased from Sigma Aldrich or Lumtec and used as received.

Electroluminescent devices were fabricated by vacuum deposition of organic and metal layers onto pre-cleaned ITO coated glass substrates under vacuum higher than $2 \times 10^{-6} \mathrm{mBar}$. ITOcoated glass substrates with a sheet resistance of $15 \Omega /$ sq were pre-patterned getting seven independent devices with area $6 \mathrm{~mm}^{2}$. Density-voltage and luminance-voltage characteristics were recorded utilizing certificated photodiode PH100-Si-HA-D0 together with the PC-Based Power and Energy Monitor 11S-LINK (from STANDA) and Keithley 2400C source meter. Electroluminescence (EL) spectra were taken by the Avantes AvaSpec-2048XL spectrometer. Device efficiencies were calculated using the luminance, current density, and EL spectra.

## Synthesis and characterization

The solvents used in the reactions were dried with standard drying agents and freshly distilled prior to use. Commercially available reagents were used as received. [4-(9H-Carbazol-9yl)phenyl]boronic acid and [3-(9H-carbazol-9-yl)phenyl]boronic acid were purchased from Fluorochem Ltd, while [3,5-di(9H-carbazol-9-yl)phenyl]boronic acid ${ }^{6}$ and 6-cyano-9phenylpurine ( PCP$)^{7}$ was prepared according to literature. All reactions were followed by: TLC on E. Merck Kieselgel 60 F254, with detection by UV light; HPLC analysis; NMR analysis. Column chromatography was performed on silica gel ( $60 \AA, 40-63 \mu \mathrm{~m}, R O C C$ ). Melting points were recorded with a Fisher Digital Melting Point Analyzer Model 355 apparatus. IR spectra were recorded in hexachlorobutadiene ( $4000-2000 \mathrm{~cm}^{-1}$ ) and paraffin oil ( $2000-450 \mathrm{~cm}^{-1}$ ) with FTIR Perkin- Elmer Spectrum 100 spectrometer. Crystallographic diffraction data were collected with a NoniusKappa CCD diffractometer (Mo-K $\alpha, \lambda=0.71073 \AA$ ) equipped with a low temperature Oxford Cryosystems Cryostream Plus device. Crystallographic data for PCbz2 are deposited at the Cambridge Crystallographic Data Centre as Supplementary Publication Number CCDC 1988182.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded with a Bruker 500 MHz spectrometers in $\mathrm{CDCl}_{3}$. Chemical shifts $(\delta)$ are reported in ppm and coupling constants $(J)$ in Hz. Residual solvent $\left({ }^{1} \mathrm{H}\right)$ or solvent $\left({ }^{13} \mathrm{C}\right)$ peaks were used as internal reference $\left(\mathrm{CDCl}_{3}: \delta=7.26 \mathrm{ppm}\right.$ for ${ }^{1} \mathrm{H}$ NMR; $\mathrm{CDCl}_{3} \delta=77.16 \mathrm{ppm}$ for ${ }^{13} \mathrm{C}$ NMR). Multiplicities are indicated as follows: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet). The non-trivial peak assignments were confirmed with $2 \mathrm{D}{ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY/HMBC and/or 2D HSQC ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ NMR for representative products within each compound class. HPLC analysis was performed using Agilent Technologies 1200 Series system equipped with XBridge C18 column, $4.6 \times 150 \mathrm{~mm}$, particle size $3.5 \mu \mathrm{~m}$, with flow rate of $1 \mathrm{~mL} / \mathrm{min}$, using $0.1 \% \mathrm{TFA} / \mathrm{H}_{2} \mathrm{O}$ and MeCN for mobile phase. Wavelength of detection was 260 nm . Eluent A - 0.1\% TFA aqueous solution with $5 \% \mathrm{v} / \mathrm{v}$ MeCN , eluent $\mathrm{B}-\mathrm{MeCN}$. Eluent $\mathrm{E}_{1}$ : gradient $30-95 \%$ B $5 \mathrm{~min}, 95 \%$ B $5 \mathrm{~min}, 95-30 \%$ B 2 min. Eluent $\mathrm{E}_{2}$ : gradient $80-95 \%$ B $5 \mathrm{~min}, 95 \%$ B $5 \mathrm{~min}, 95-80 \%$ B 2 min . LC/MS was recorded with Waters Acquity UPLC system equipped with Acquilty UPLC BEH C18 $1.7 \mu \mathrm{~m}$, $2.1 \times 50 \mathrm{~mm}$; using $0.1 \% \mathrm{TFA} / \mathrm{H}_{2} \mathrm{O}$ and MeCN for mobile phase. HRMS analyses were performed on Agilent 1290 Infinity series UPLC system equipped with column Extend C18 RRHD $2.1 \times 50 \mathrm{~mm}, 1.8 \mu \mathrm{~m}$ connected to Agilent 6230 TOF LC/MS masspectrometer. Oil bath with controlled temperature was used for all reactions that were carried out at elevated temperatures.
