This is the supplementary information for the manuscript entitled: "Electronic Spectra  
of Ytterbium Fluoride from Relativistic Electronic Structure Calculations" by J. V. Po-  
totschnig, K. G. Dyall, L. Visscher and A. S. P. Gomes.

In section 1 a closer look is taken at the orbitals and their energies for the two differ-  
ent references, either with a closed or open f-shell. Orbital energies for different diatomic  
distances are depicted alongside orbitals for the YbF diatomic. Section 2 contains addi-  
tional results obtained for Kramers restricted configuration interaction. Firstly, we compare  
results obtained with the X2C-AMFI code to full 4-component computations. Next, poten-

tial energy curves, including spectroscopic parameters, and dipole moments—both transition dipole moments (TDM) and permanent electric dipole moments (PEDM)—for different basis set sizes are presented. Subsequently, the problem of the relative position of the  $f^{13}$  and  $f^{14}$  states is addressed and its basis set dependence. Lastly, transition dipole moments are listed. Section 3 contains the potential energy curves and spectroscopic parameters for different basis set sizes applying the Fock space coupled cluster method and spectroscopic parameters for the states after adiabatic mixing as presented in the main text. An extended list of equation-of-motion coupled cluster transition energies for the  $\text{Yb}^+$  is listed in section 4. This section also contains EOM-CCSD potential energy curves for different basis set sizes. Finally, in section 6 Franck-Condon factors for potentials stemming from the different methods are depicted and compared. Additional figures (orbital pictures, basis set convergence) can be found in the first version of this manuscript on arXiv.<sup>1</sup>

# 1 Orbitals

## 1.1 Orbital energies

In this part the orbital energies obtained by AOC-SCF for several internuclear separations are shown.

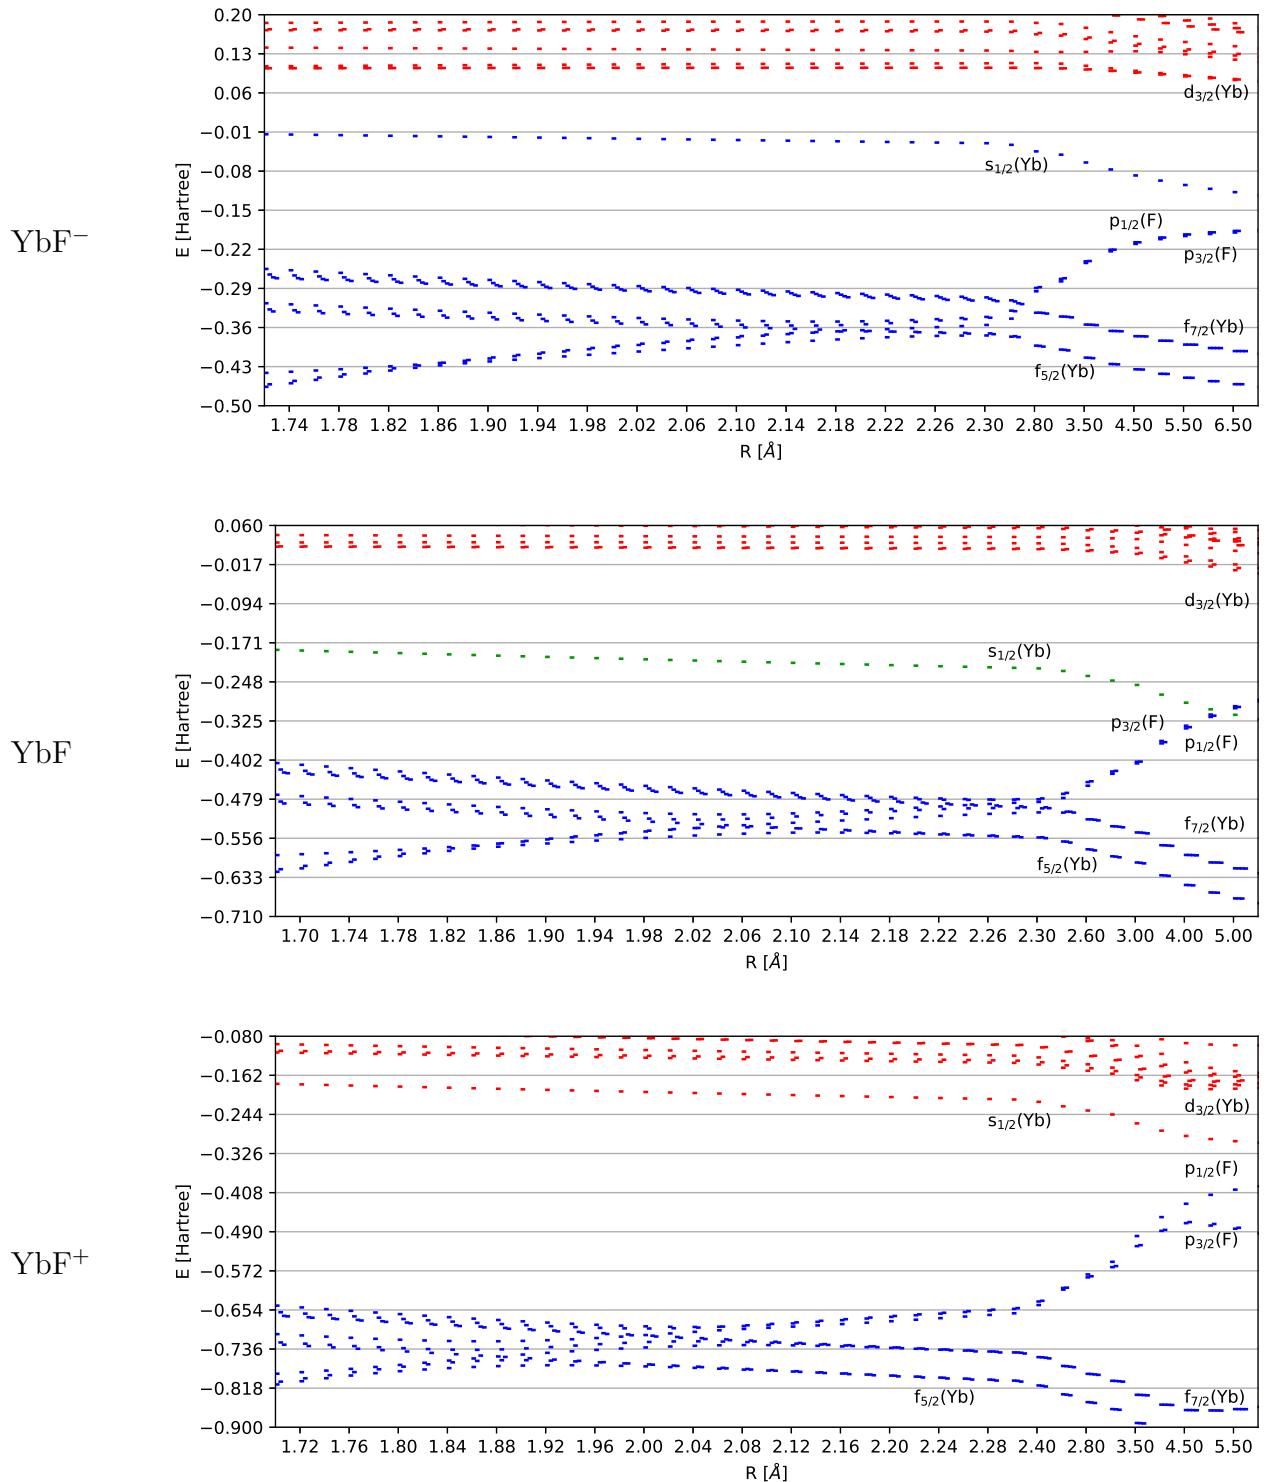

Figure S1: Orbital energies for different bond distances. Blue, green, and red are occupied, partially filled, and virtual orbitals, respectively.

## 1.2 Diatomic orbitals - equilibrium distance

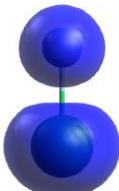

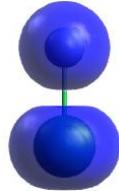

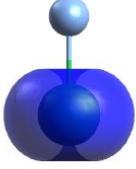

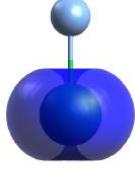

This section contains orbitals of the YbF diatomic for a internuclear distance close to the ground state equilibrium one.

Table S1: Orbitals obtained from an AOC-SCF computations either with a fully occupied ( $f^{14}$ ) or single hole ( $f^{13}$ ) f-shell for YbF with a distance of 2 Å. For each orbital we list the orbital energy according to a Koopman's definition.<sup>2,3</sup> The contributing atomic orbitals contributing have been given in the first column.

## 2 Kramers restricted configuration interaction (KRCI)

### 2.1 Hamiltonian

Due to limitations in the implementation it is not possible to run the more accurate  $^2\text{DC}^M$ <sup>4</sup> in combination with Kramers-restricted configuration interaction. Therefore, we have run the computations with the X2C-AMFI<sup>5,6</sup> Hamiltonian. In order to estimate the influence of this approximation we compare the results with the 4-component Dirac-Coulomb-Breit Hamiltonian (DCB)<sup>7</sup> in tables S2 and S3 for the Yb cation. The effect of the basis set

Table S2: Transition energies ( $\text{cm}^{-1}$ ) and line strengths / squared transition dipole moments ( $e^2 a_0^2$ ) for the Yb cation. Reference values have been obtained from the NIST database,<sup>8</sup> the computed values were obtained for different basis sets with Kramers-restricted configuration interaction.

is much larger and since no significant impact can be expected we used the X2C-AMFI Hamiltonian to obtain the data.

## 2.2 Closed f-shell - potential energy curves

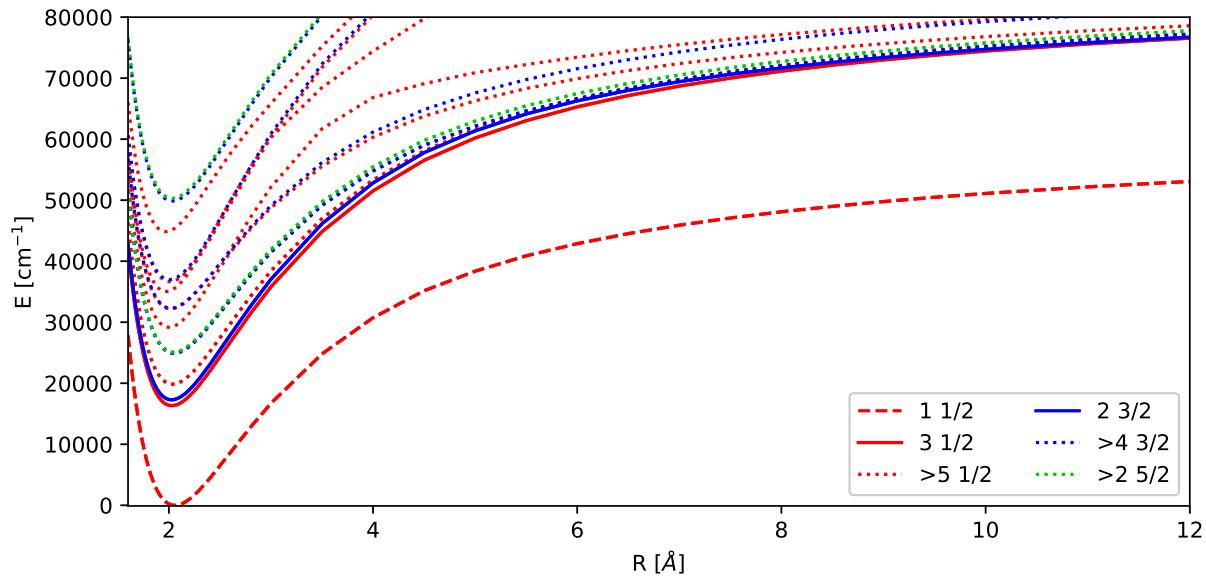

Figure S2: KRCI PECs for states with  $f^{14}$  for the quadruple zeta basis sets.

Table S4: Spectroscopic constants for the different electronic states ( $\Omega = 1/2, 3/2, 5/2$ ) with  $f^{14}$  obtained by KRCI for the double and triple zeta basis sets. Vibrational constant ( $\omega_e$ ), anharmonicity constant ( $\omega_e\chi_e$ ), and transition energy ( $T_e$ ), are given in  $\text{cm}^{-1}$ , the equilibrium bond distance ( $r_e$ ) in Å.

## 2.5 Open f-shell - dipole moments

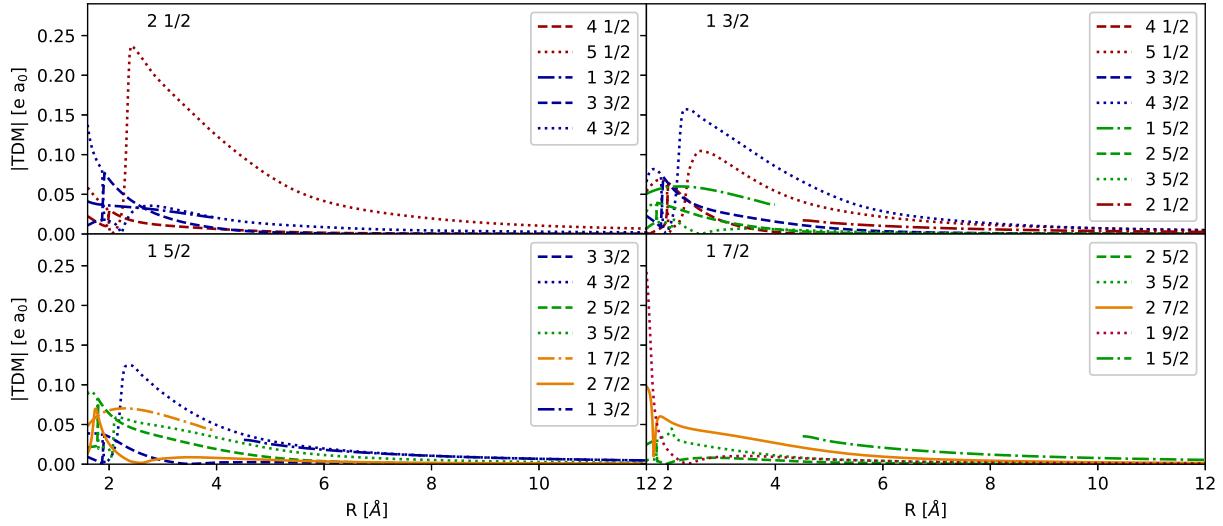

Figure S6: KRCI TDMs for states with  $f^{14}$  for the quadruple zeta basis sets.

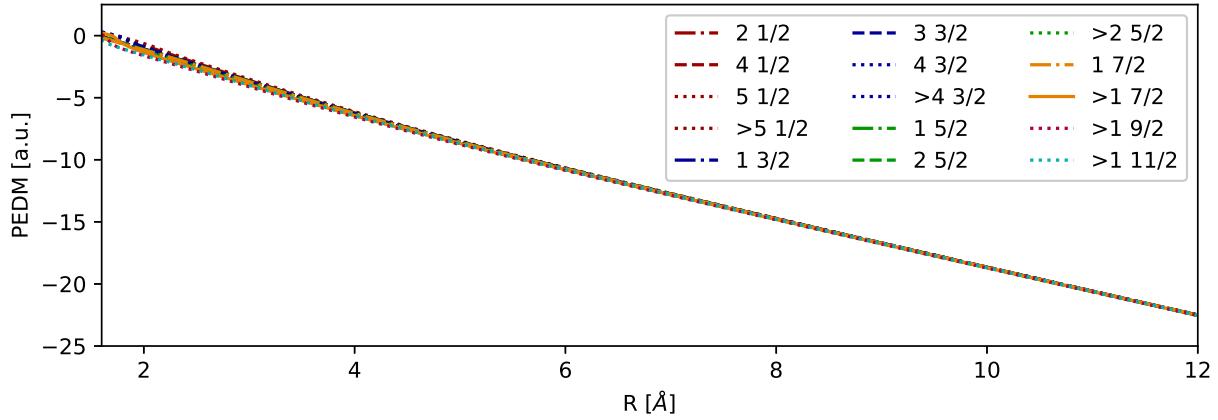

Figure S7: KRCI PEDMs for states with  $f^{13}$  for the quadruple zeta basis sets.

## 2.6 Combined potentials, shifting

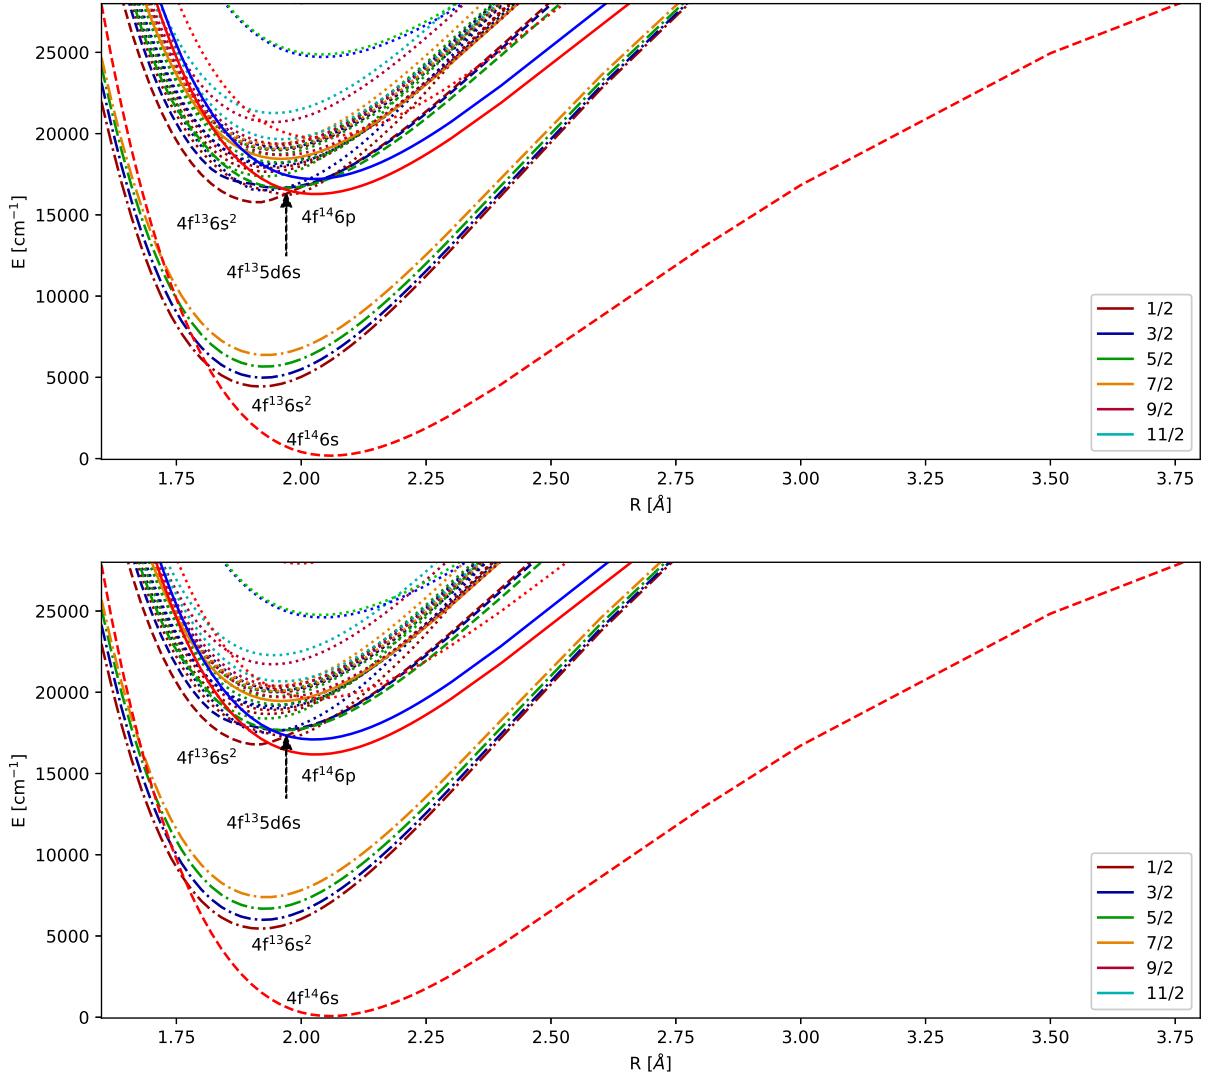

Figure S8: Combination of the sets of KRCI potentials. The lowest  $\Omega = 1/2$  are denoted by the assigned dominant configuration. For the upper part the shift was applied at 15 Å, for the lower part at 10 Å.

The combination of the potential energy by shifting according to the outermost point is shown in figure S8. While the minimum of the potential changes from about 55000 to 51000  $\text{cm}^{-1}$ , there are only small changes in the relative position of the minima of different electronic states.

Figure S9 shows the combined potentials energy curves for larger bond distances.

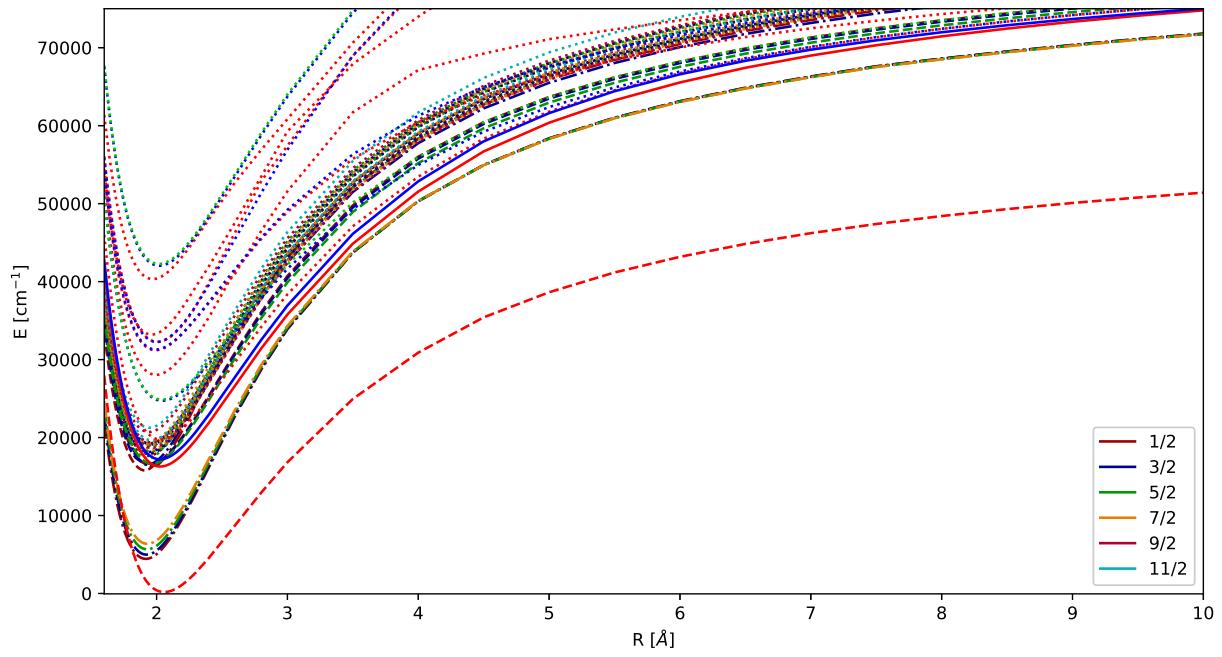

Figure S9: KRCI PECs for states with open and closed f-shell for extrapolation to the basis set limit.

## 2.7 Collection - transition dipole moments

Table S8: KRCI transition dipole moment table for the equilibrium distances of the lower state, corresponding to the TDMs displayed in figures S3 and S6. Values for the dyall.v4z basis set are listed.

### 4.3 Open f-shell - potential energy curves

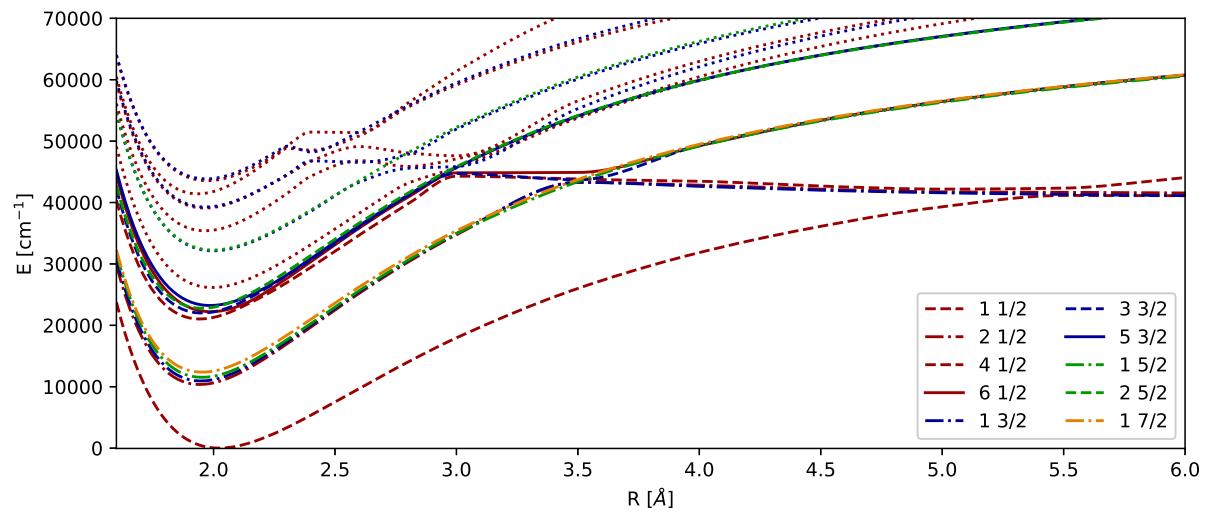

Figure S15: EOM-CCSD PECs for states from the (1h, 0p) sector with a anion reference for the quadruple zeta basis sets.

Table S16: Spectroscopic constants for the different electronic states ( $\Omega = 1/2, 3/2, 5/2$ ) obtained by EOM-CCSD for the (1h,0p) sector using different basis set sizes. Vibrational constant ( $\omega_e$ ), anharmonicity constant ( $\omega_e\chi_e$ ), and transition energy ( $T_e$ ), are given in  $\text{cm}^{-1}$ , the equilibrium bond distance ( $r_e$ ) in Å.

## 4.4 Combined potentials

Figure S16 shows the PECs for longer bond distances.

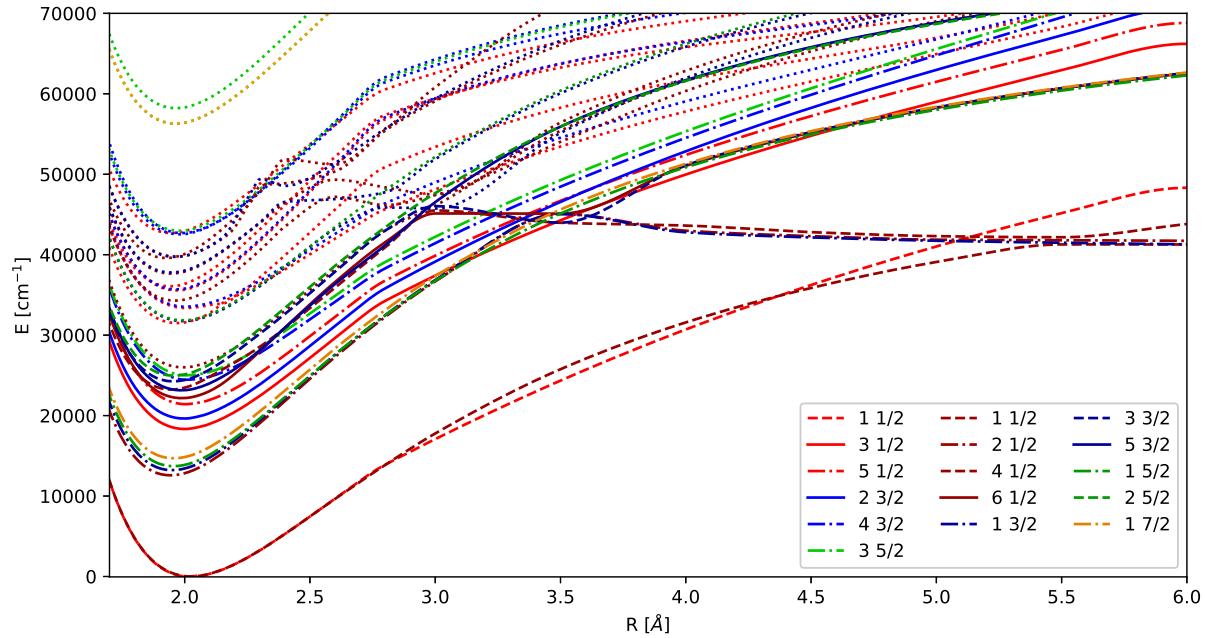

Figure S16: EOM-CCSD PECs generated by the use of two different sectors and reference systems for extrapolation to the basis set limit.

## 5 Spectroscopic parameters

Table S17 contains the complete list of calculated states, of which a selection was presented in table 7 in the main manuscript.

Table S17: Spectroscopic constants for excited states with  $\Omega = 1/2, 3/2, 5/2$ , starting from  $18000 \text{ cm}^{-1}$  for different methods using the values after extrapolation to the basis set limit. Transition energy ( $T_e$ ), vibrational constant ( $\omega_e$ ), and anharmonicity constant ( $\omega_e\chi_e$ ) are given in  $\text{cm}^{-1}$ , the equilibrium bond distance ( $r_e$ ) in Å. Experimental transitions that were not assigned(n.a.) are also listed.

<sup>a</sup> KRCI transition energies for the 4f<sup>13</sup> sector were obtained by adding 4144 cm<sup>-1</sup>, an estimate for the energy of the lowest state in this manifold.

## 6 Frank-Condon factors (FCFs) for different methods

Frank-Condon factors are shown in figure S17 for MRCI, EOM-CCSD and IHFS-CCSD. From it, we observe a marked difference between the configuration interaction and coupled cluster results: first, the equilibrium distance and curvature are quite different, something that, in turn, change the overlap and resulting Frank-Condon factors as well as the progression of the vibrational levels.

Additionally, there is more uncertainty with regards to the position of the potential energy curves, as configuration interaction is not size consistent and we observe transition in the range from 14000 to 19000 cm<sup>-1</sup> for these states. The states are more dense in this case, which is expected as states of the Yb(4f<sup>13</sup>[F<sub>7/2</sub>]<sup>o</sup>]5d<sup>1</sup> $\sigma_{6s}^1$ )F configuration are included, which

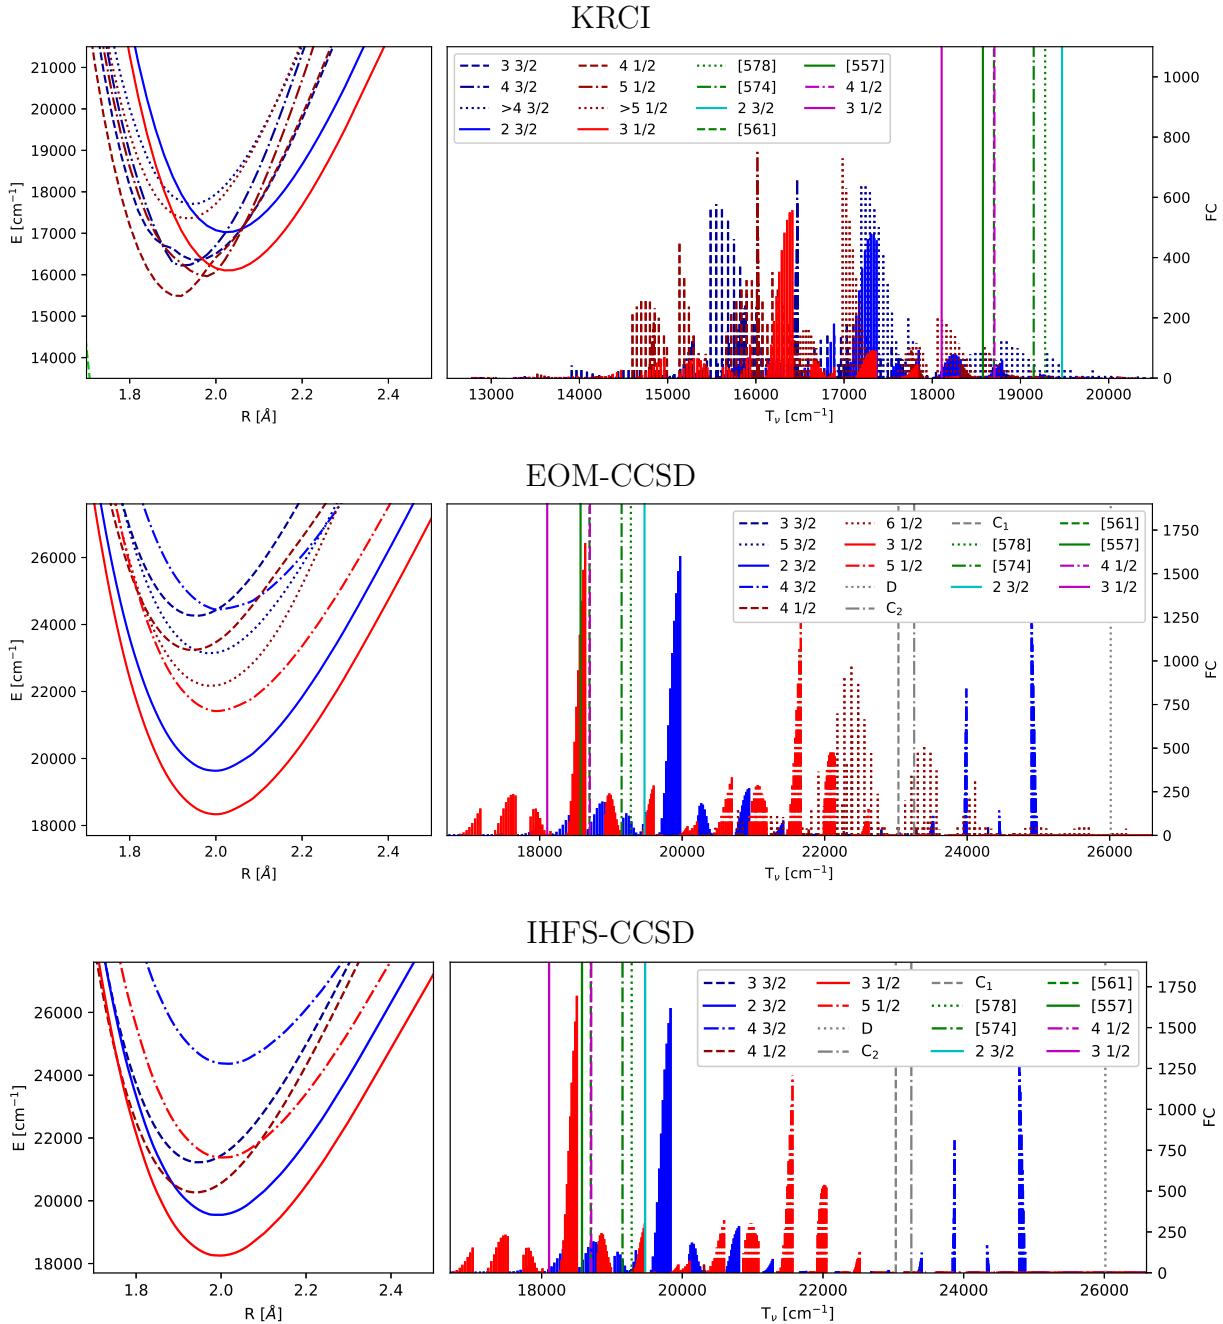

Figure S17: Frank-Condon factors obtained with the LEVEL program<sup>15</sup> by using the potential energy curves on the left, which have been obtained by different ab-intio methods. The lowest 10 vibrational levels of the ground state were used as well as the lowest 60 vibrational levels of the excited state. The experimental values have been added as straight lines.<sup>11–13</sup>

are missing in the coupled cluster descriptions.

The EOM-CCSD and IHFS-CCSD Frank-Condon factors are quite similar to each other, with the exception of the additional  $6_{1/2}$  state in EOM-CCSD, probably stemming from the contributions by  $(2\text{h},1\text{p})/(1\text{h},2\text{p})$  to the final states. The results for the  $3_{1/2}$  and  $2_{3/2}$  state are close to the experimentally observed positions, only about  $500\text{ cm}^{-1}$  too high, and show the same splitting. The transition of the  $5_{1/2}$  states are also similar in both coupled cluster treatments.
