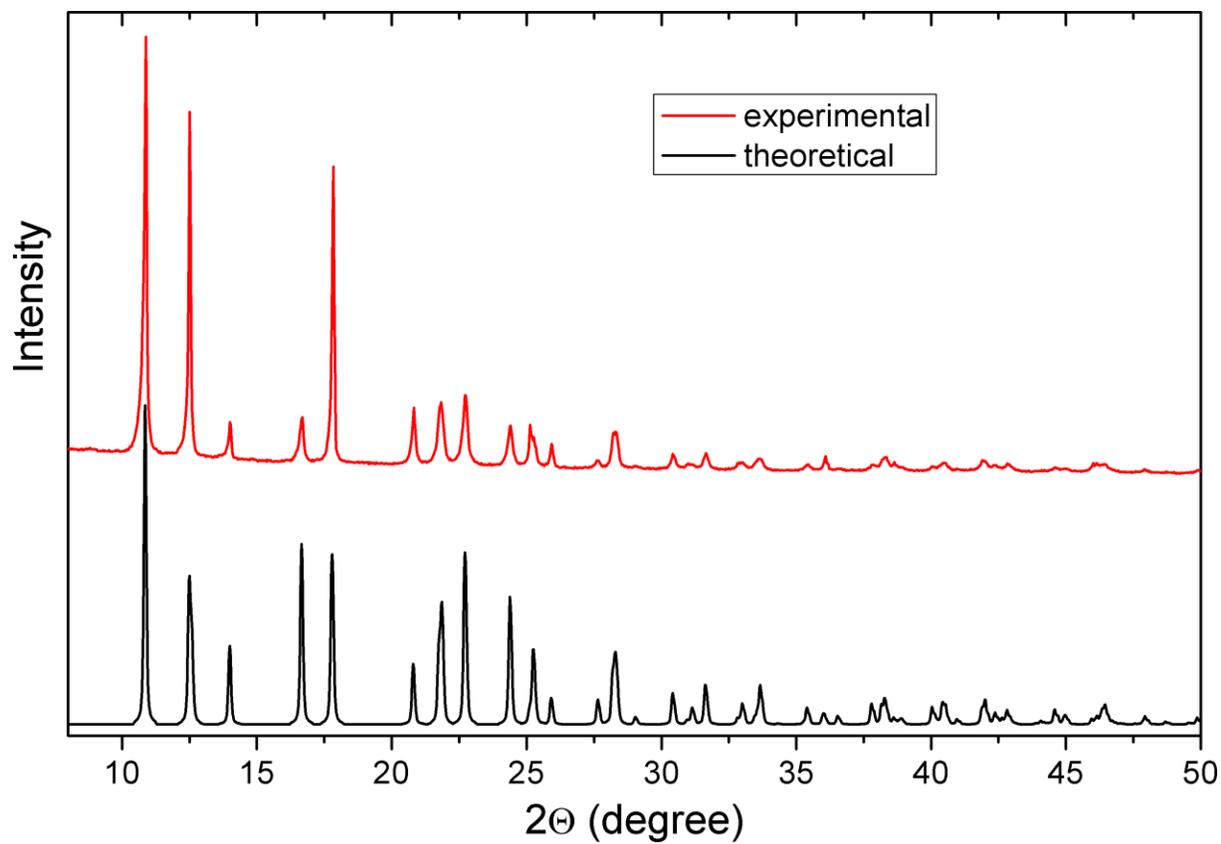

Figure S1. Room-temperature powder XRD pattern for the as-prepared BeTriMeCd together with the calculated one based on the RT single crystal structure.

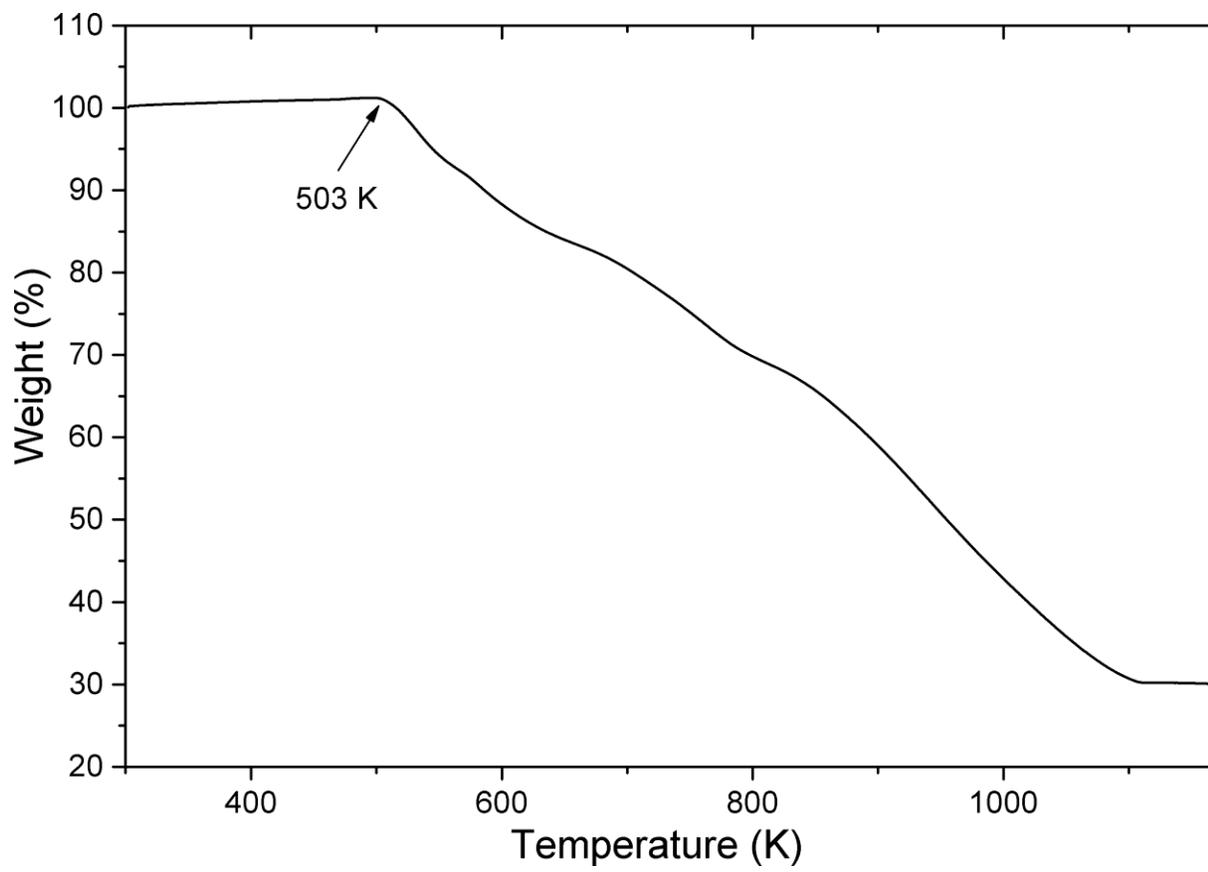

Figure S2. TGA plot of BeTriMeCd.

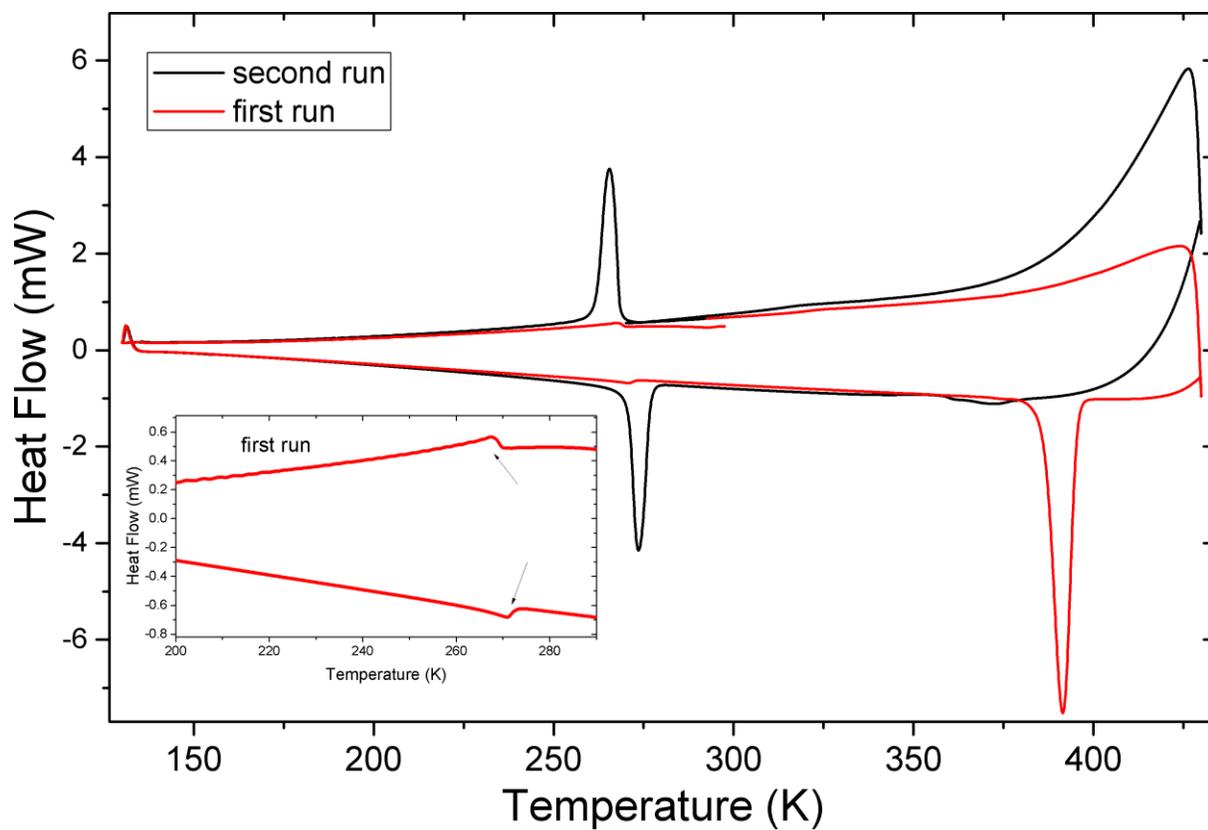

Figure S3. DSC traces for BeTriMeCd: cooling from 298 K to 130 K, heating to 430 K and cooling to 290 K (1st run, red line; 2nd run, black). Insert shows weak DSC anomalies near 270 K observed during the first run.

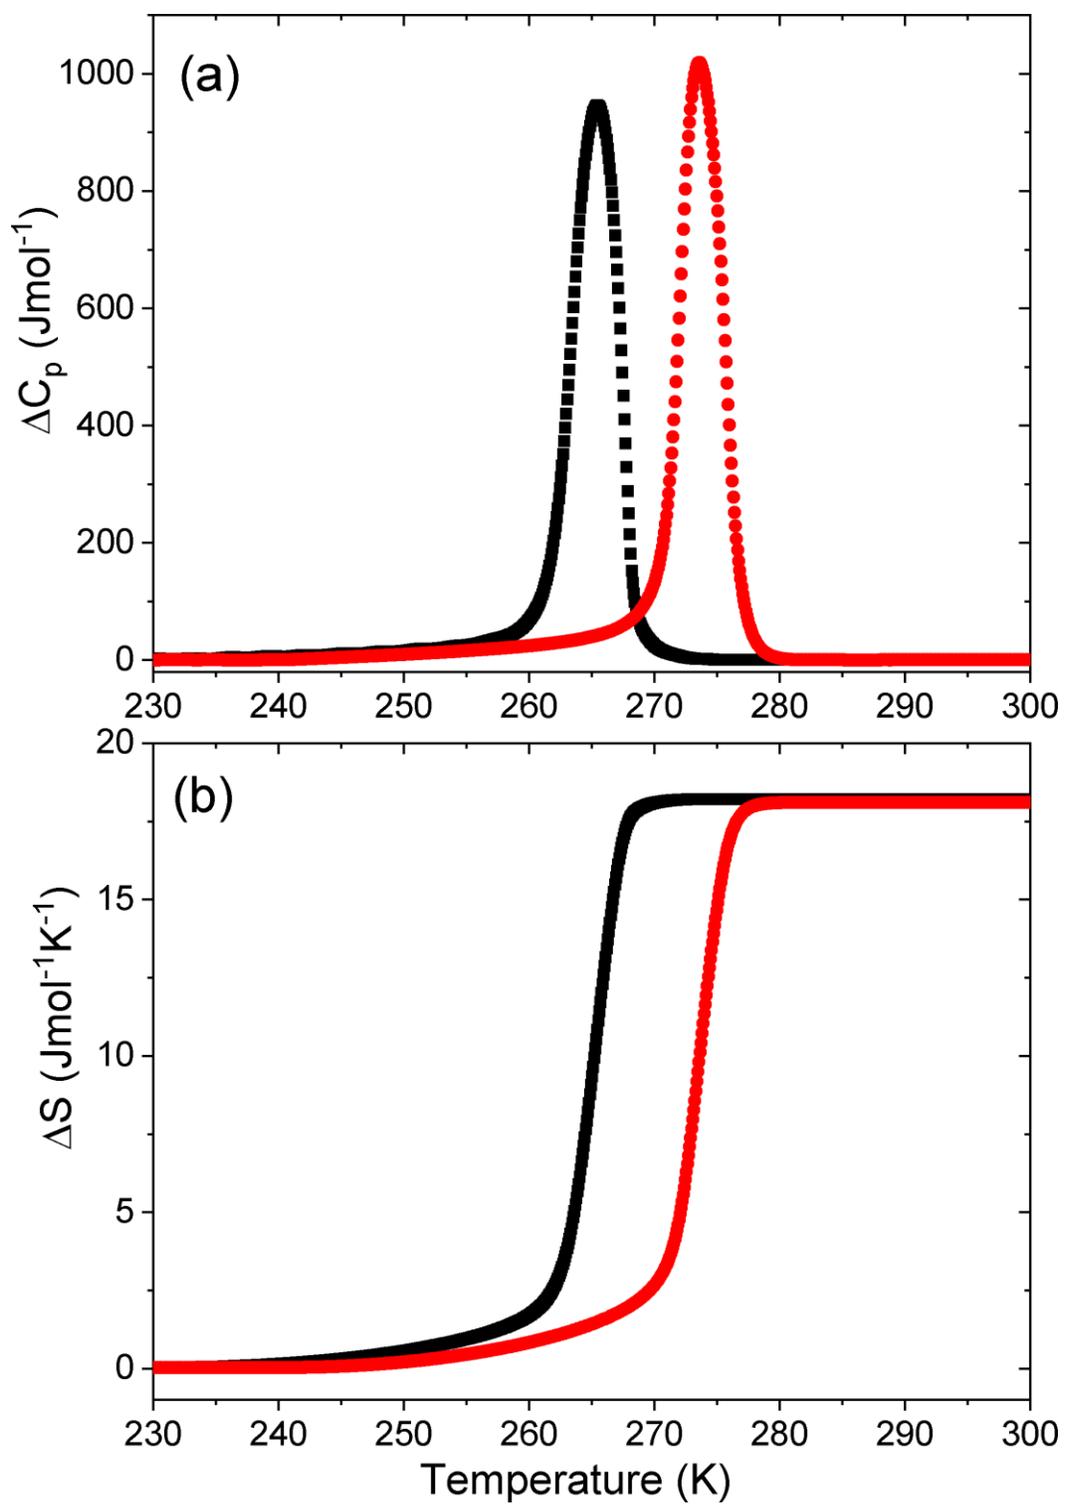

Figure S4. The change in C_p (a) and S (b) for BeTriMeCd in 2nd run: cooling is denoted by black line and heating by read line.

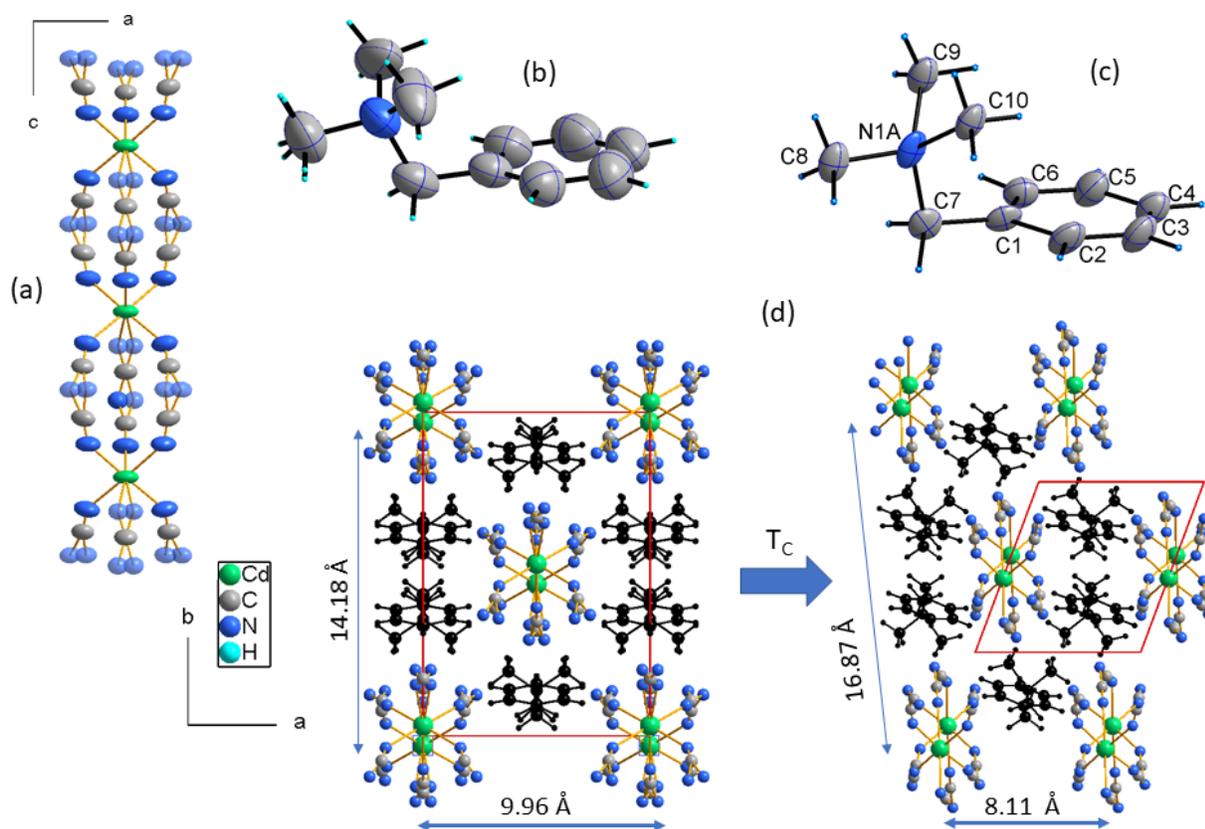

Figure S5. The details of the crystal structure of BeTriMeCd in (a)-(b) Phase I, (c) BeTriMe⁺ in Phase II with atom numbering, the displacement ellipsoids are drawn at 50% probability, (d) distortion of the crystal structure as seen along the polar direction. In II radical elongation of the interchain distance in b_{ortho} occurs, on the other hand, the interchain distances in a_{ortho} are reduced in a comparable degree.

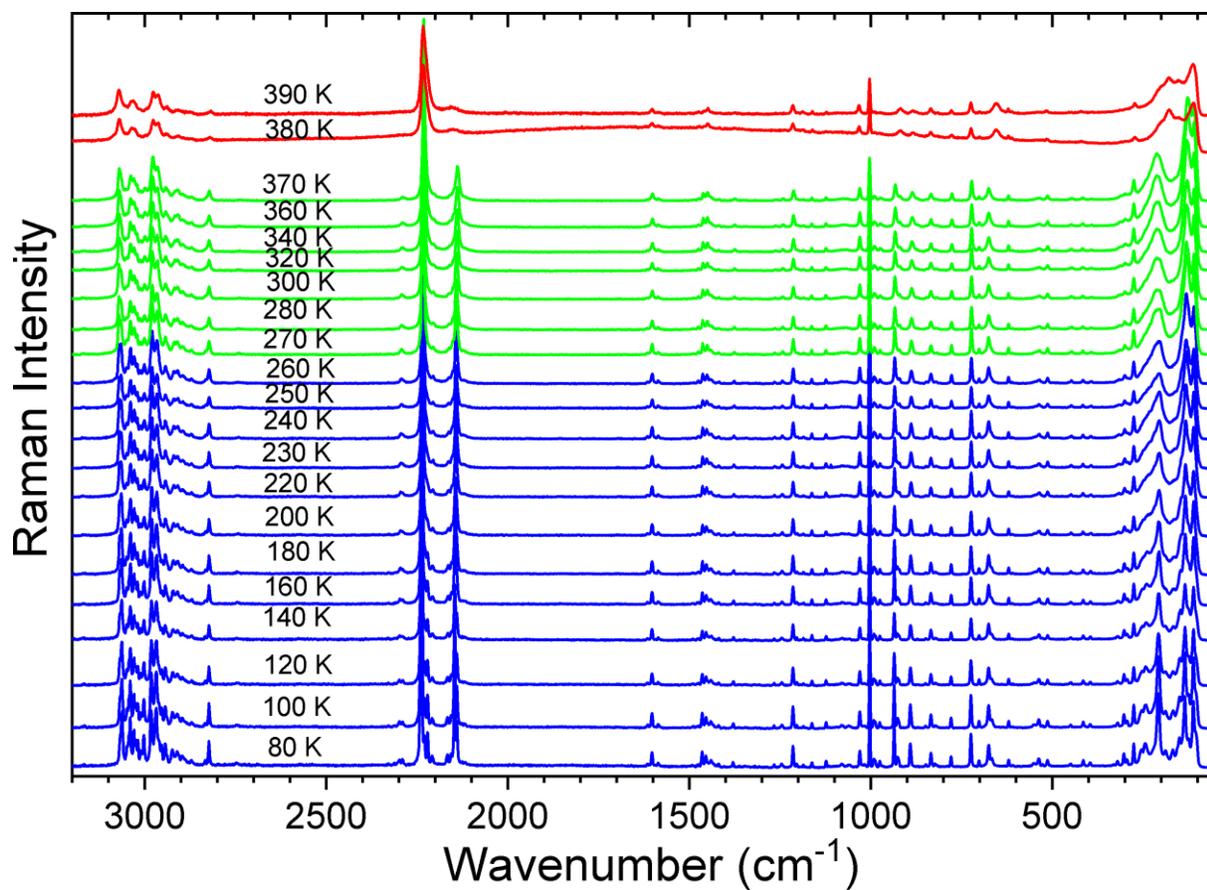

Figure S6. Raman spectra of BeTriMeCd in the heating run from 80 to 390 K (3200-50 cm^{-1} range).

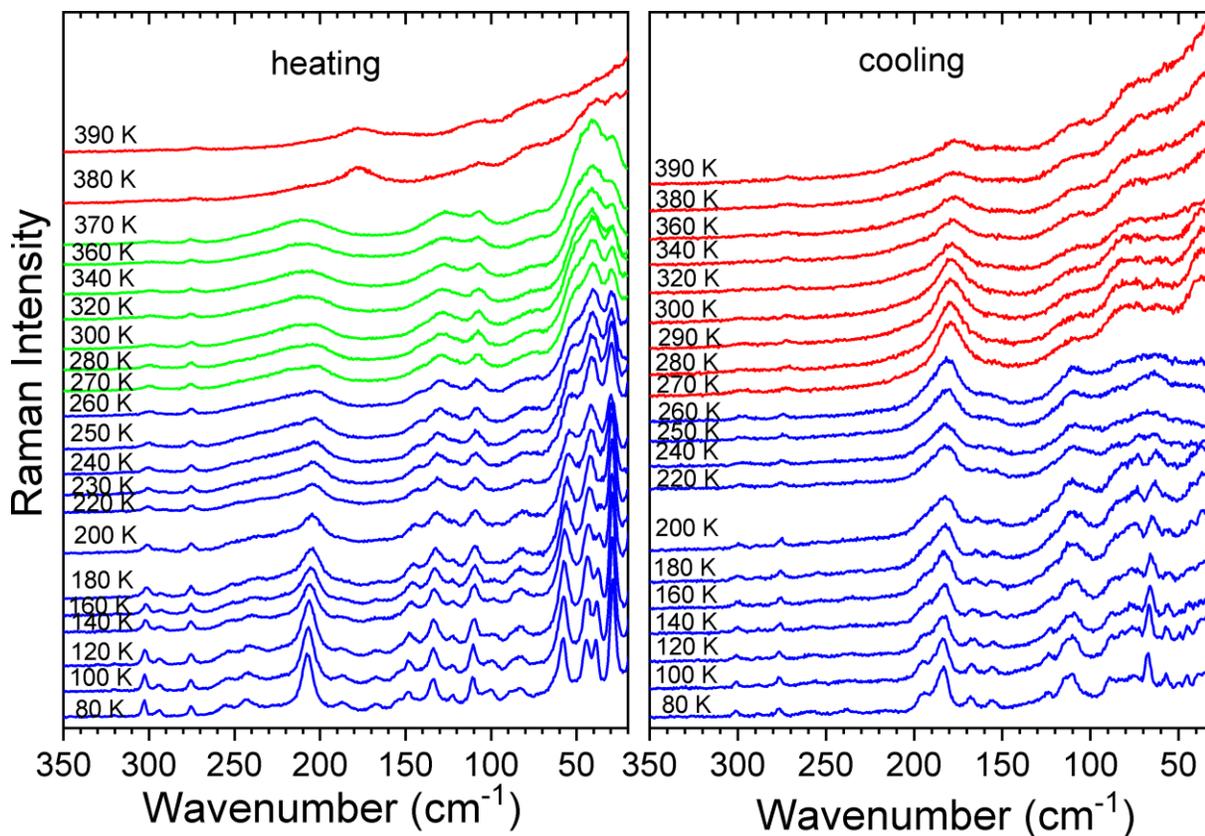

Figure S7. Low-wavenumber Raman spectra of BeTriMeCd measured using the Eclipse filter in the heating (left panel) and cooling (right panel) runs.

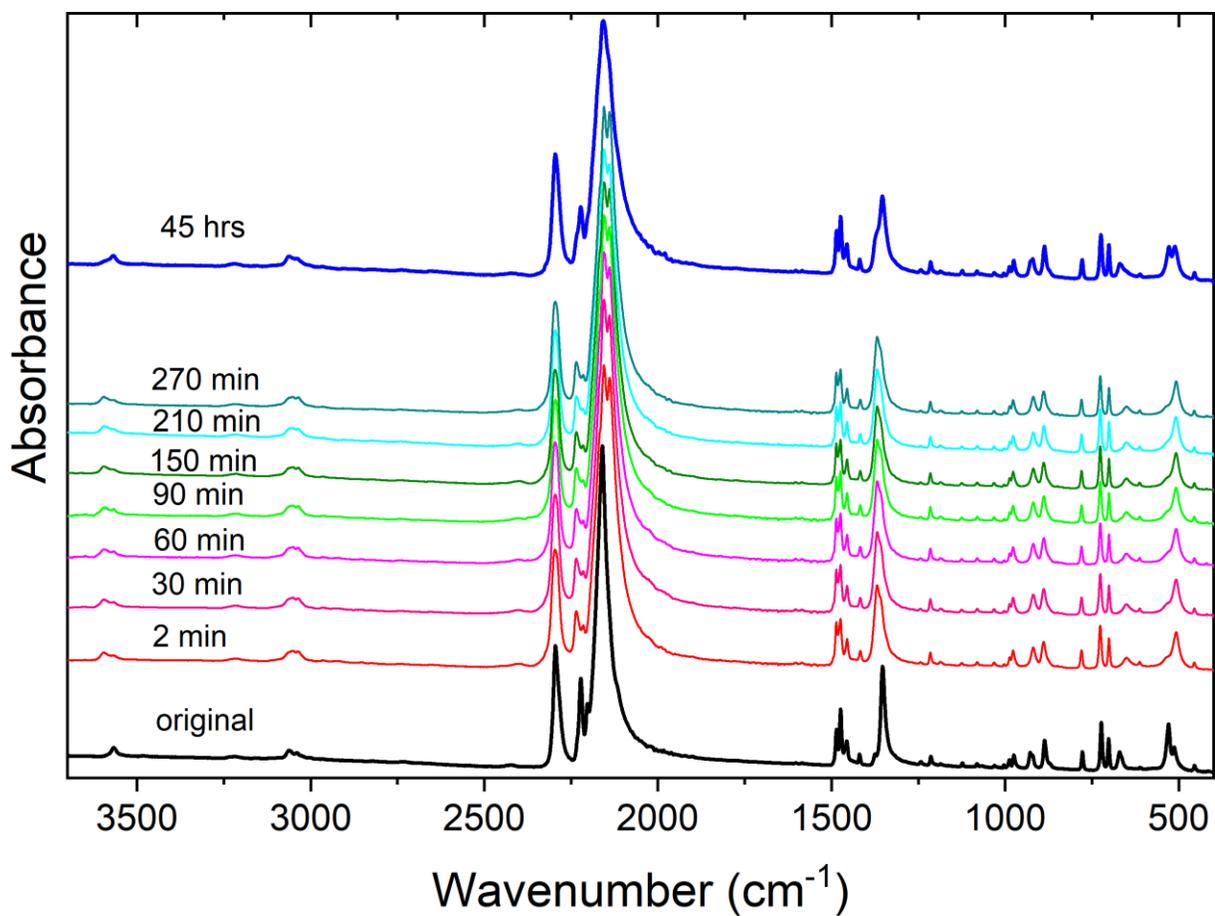

Figure S8. ATR spectra of the original BeTriMeCd sample and the same sample heat-treated at 400 K and kept at room-temperature for 2, 30, 60, 90, 150, 210 and 270 min as well as 45 hours.

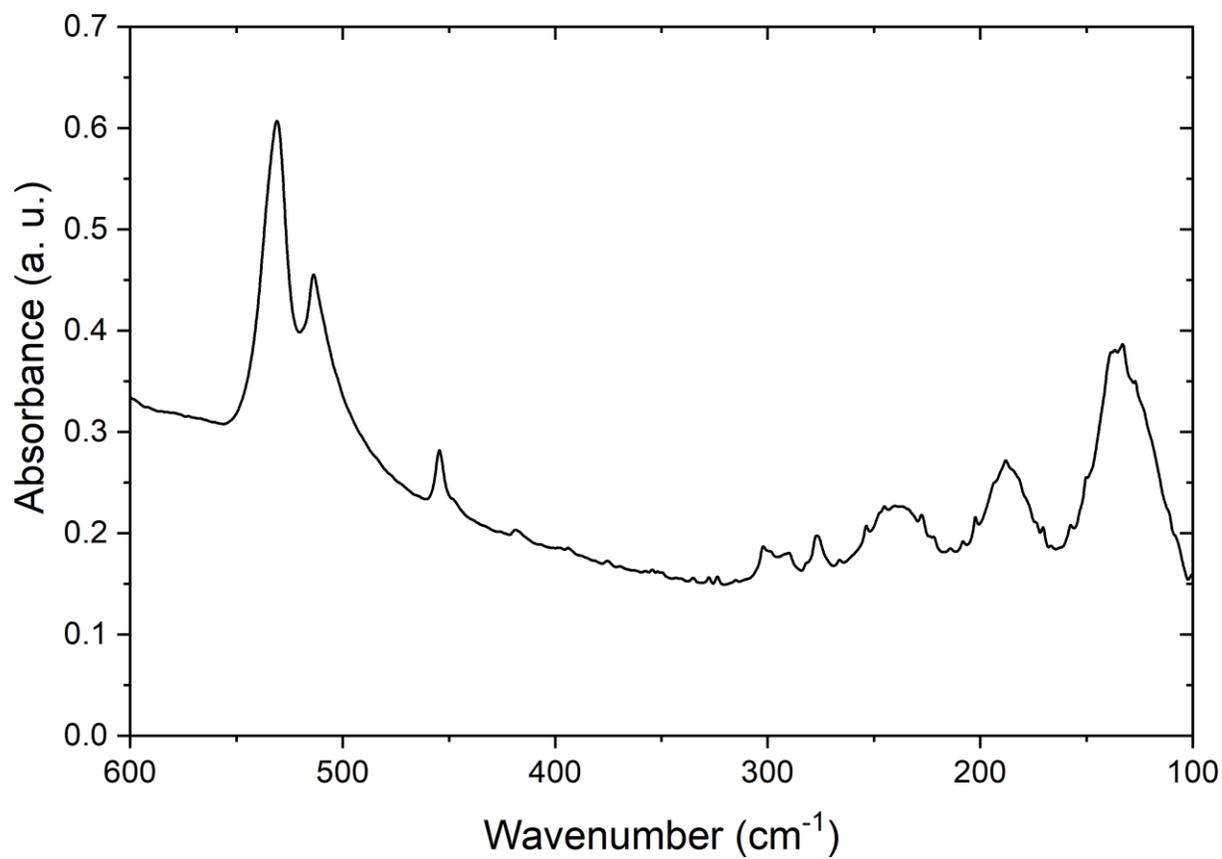

Figure S9. Far-IR spectrum of BeTriMeCd recorded at RT.

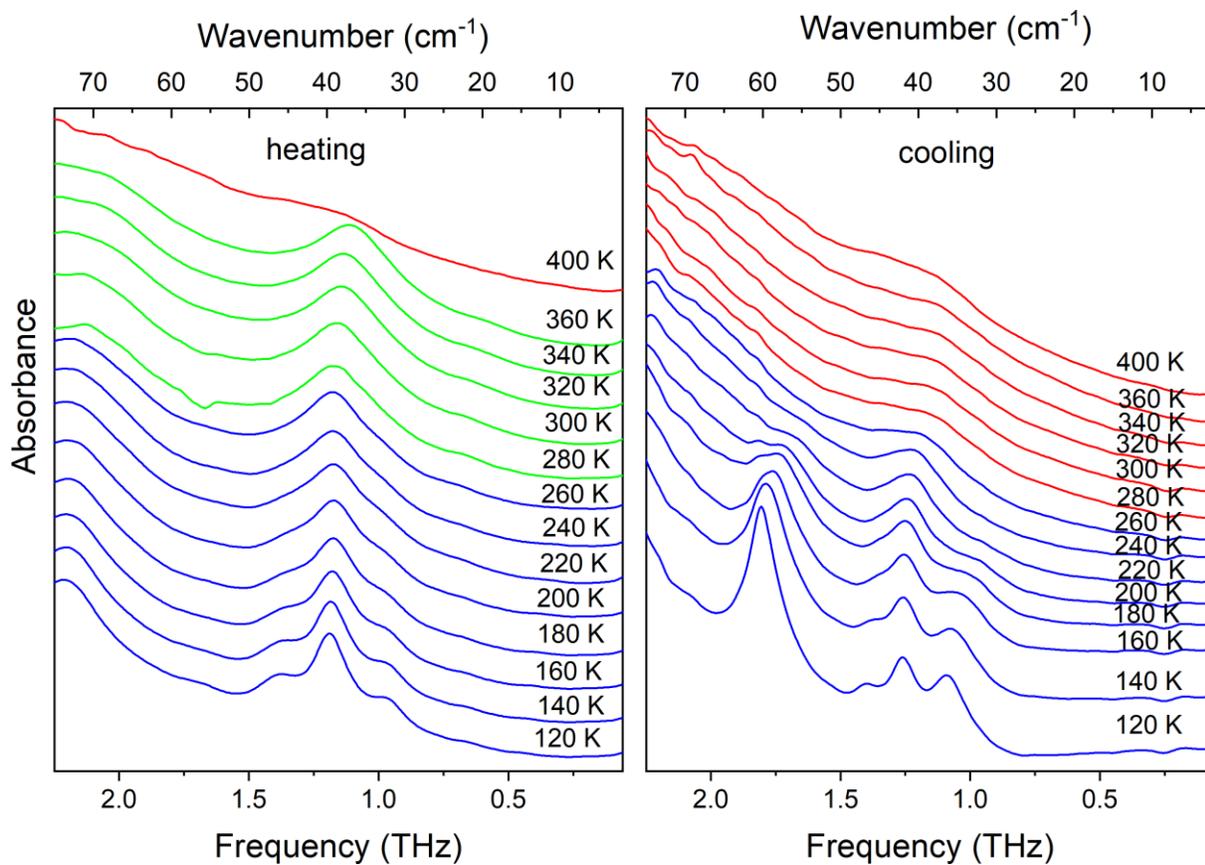

Figure S10. Temperature-dependent THz spectra of BeTriMeCd recorded in the heating and cooling runs.

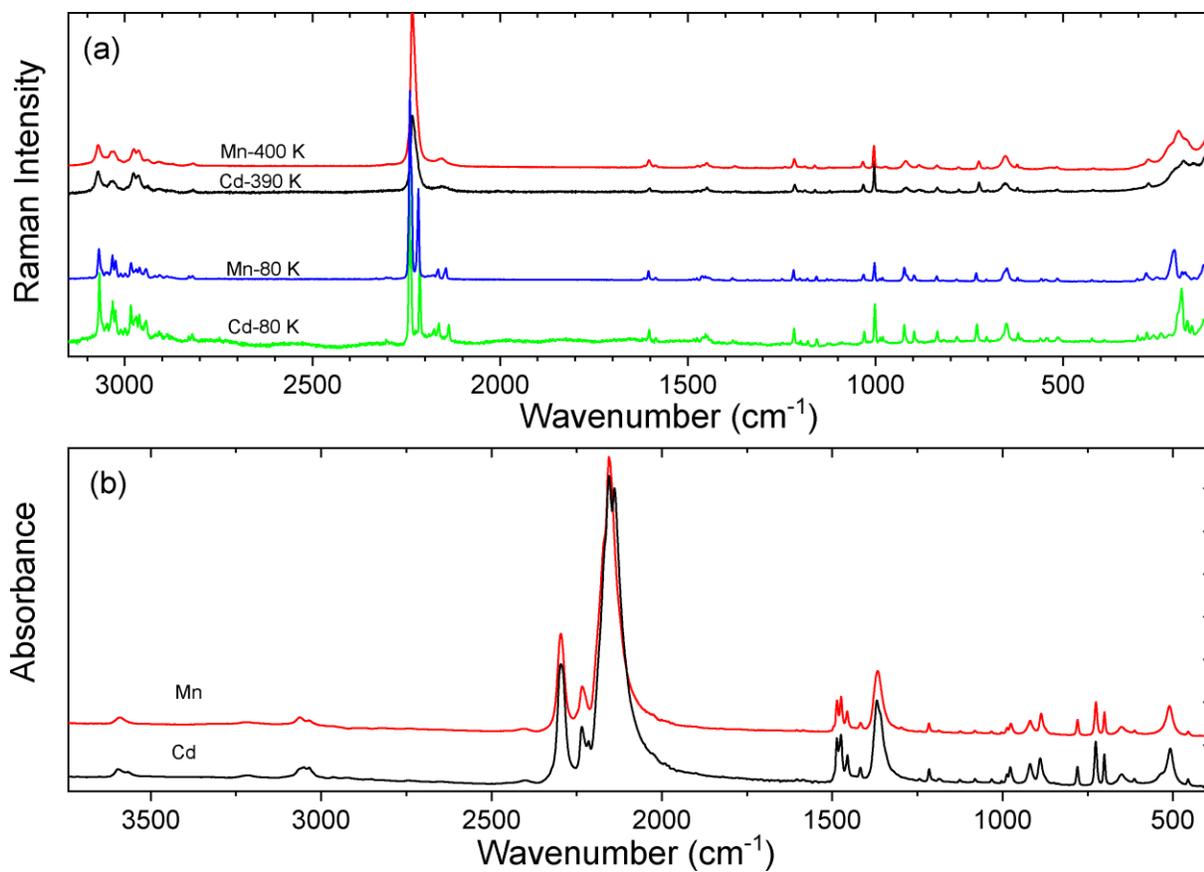

Figure S11. (a) Raman spectra of the BeTriMeCd and BeTriMeMn samples measured at 390 and 400 K, respectively, and the spectra of the same compounds recorded for the heat-treated samples at 80 K. (b) RT ATR IR spectra of the BeTriMeCd and BeTriMeMn samples heat-treated at 400K.

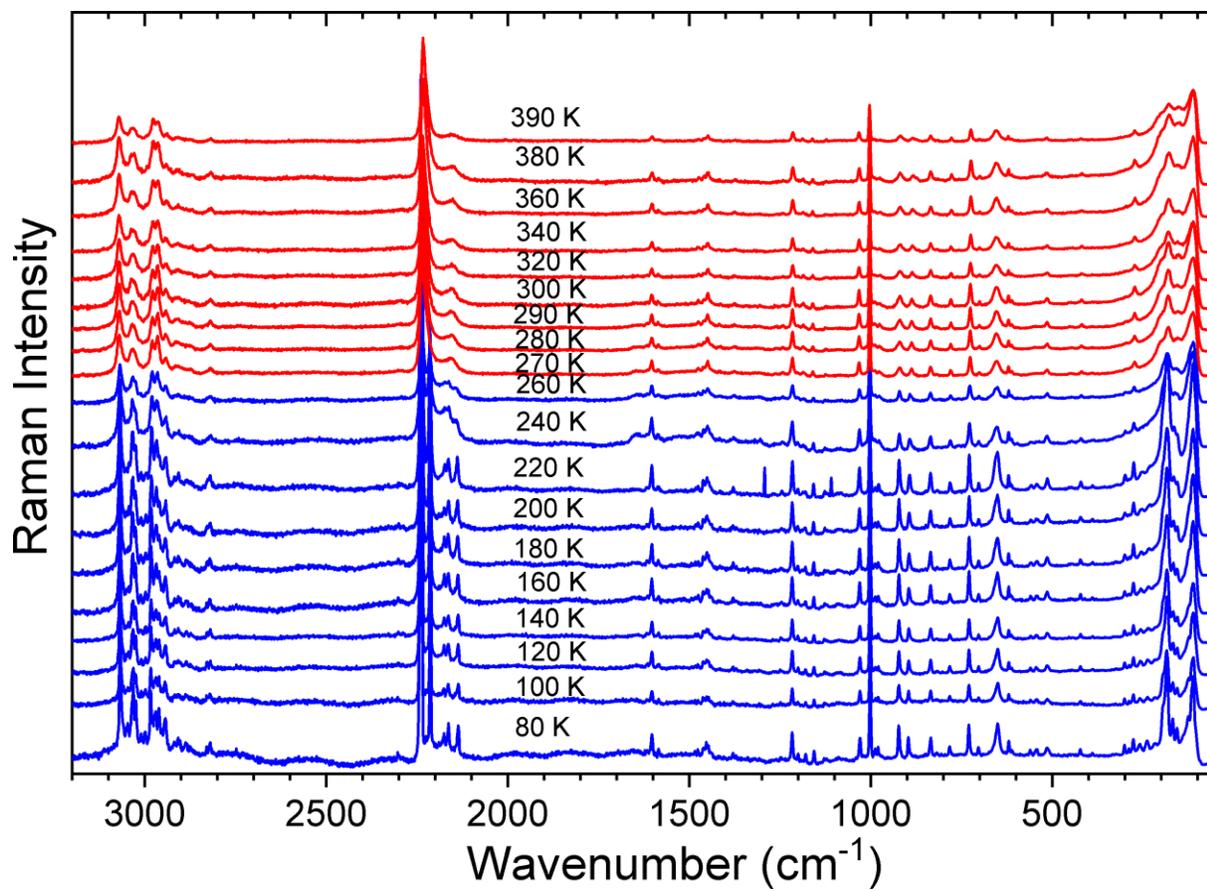

Figure S12. Raman spectra of BeTriMeCd in the cooling run from 390 to 80 K (3200-50 cm^{-1} range).

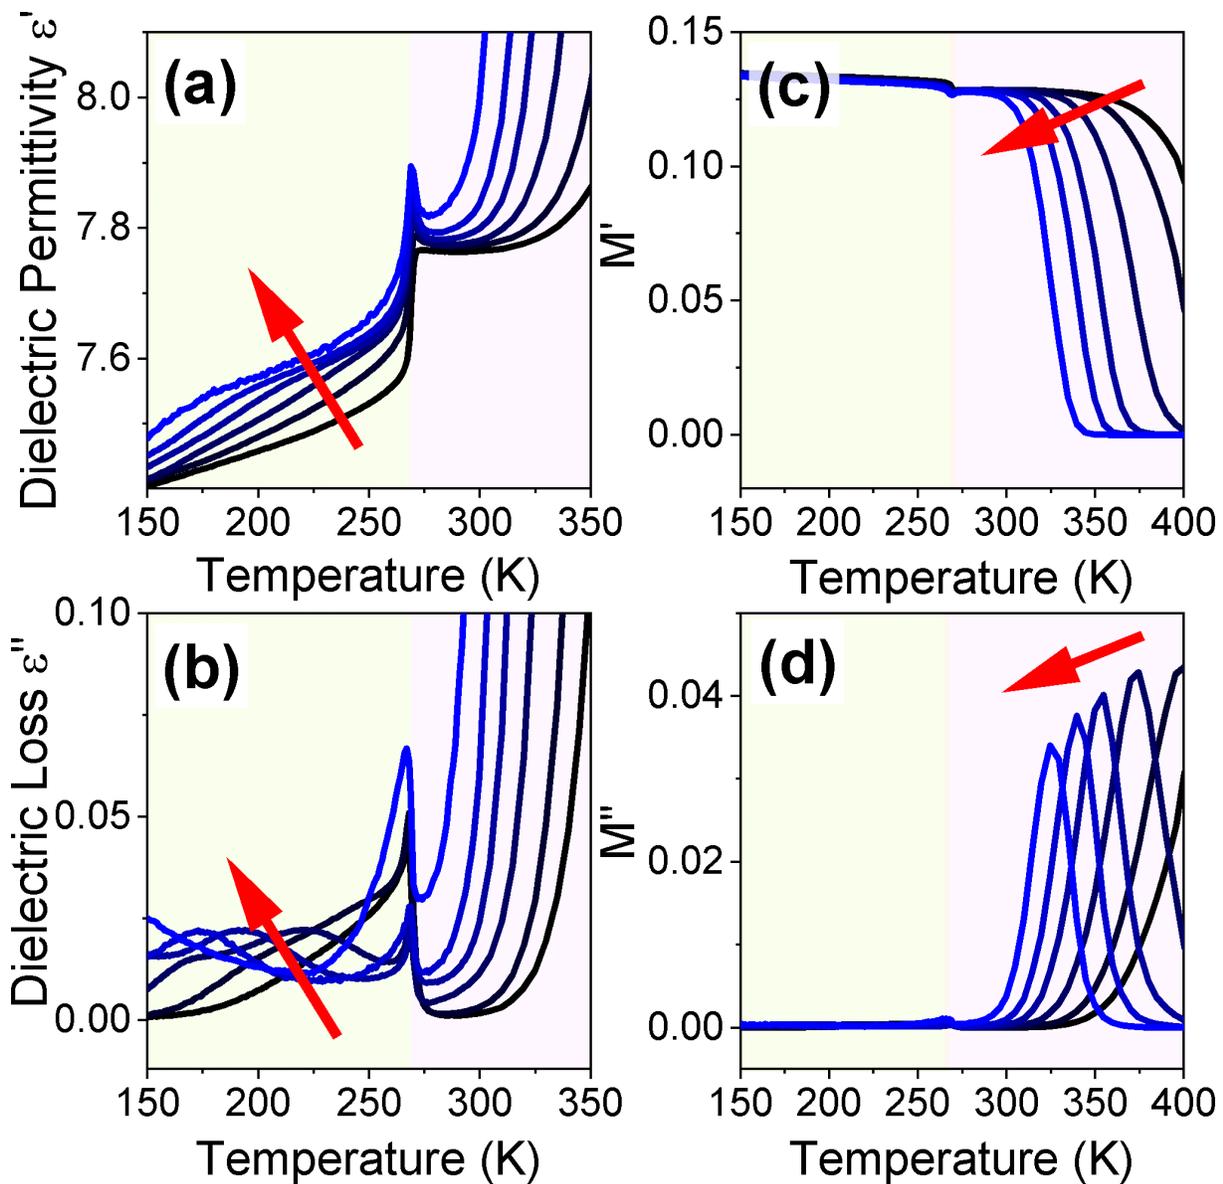

Figure S13. Temperature dependence of the complex dielectric permittivity ϵ' (a) dielectric loss ϵ'' , (b) and electric modulus parts M' (c), M'' (d) for selected frequencies from the range 10Hz to 1MHz for BeTriMeCd polycrystalline sample. The marked areas indicate the different phases during cooling from 400K.

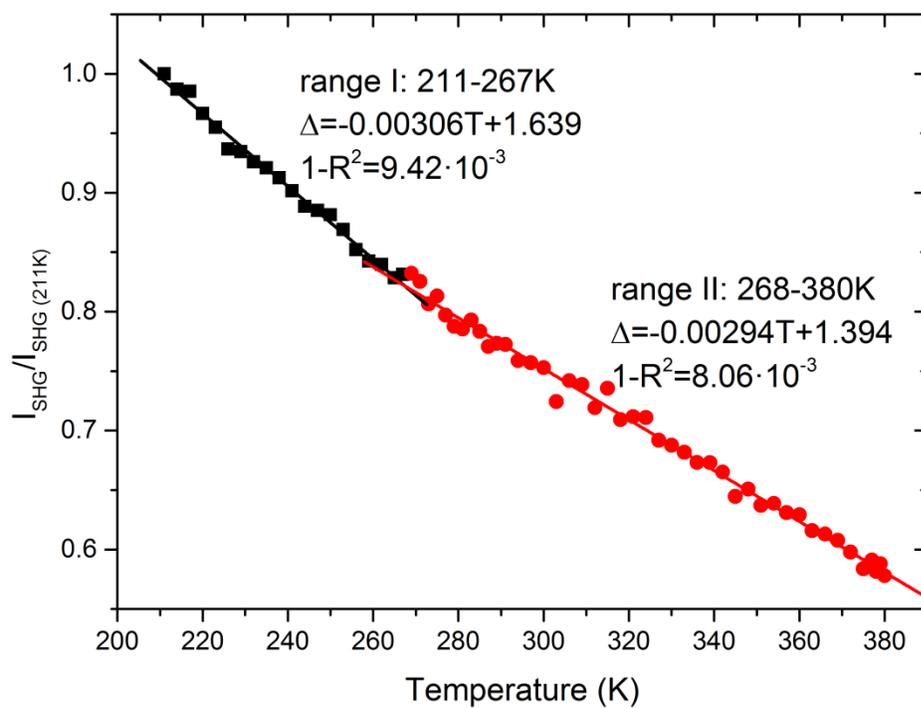

Figure S14. Plot of thermometric parameter Δ ($\Delta = I_{\text{SHG}} / I_{\text{SHG}}(211\text{K})$) in the function of temperature for BeTriMeCd. Linear functions led through two sets of points serve as calibration curves.

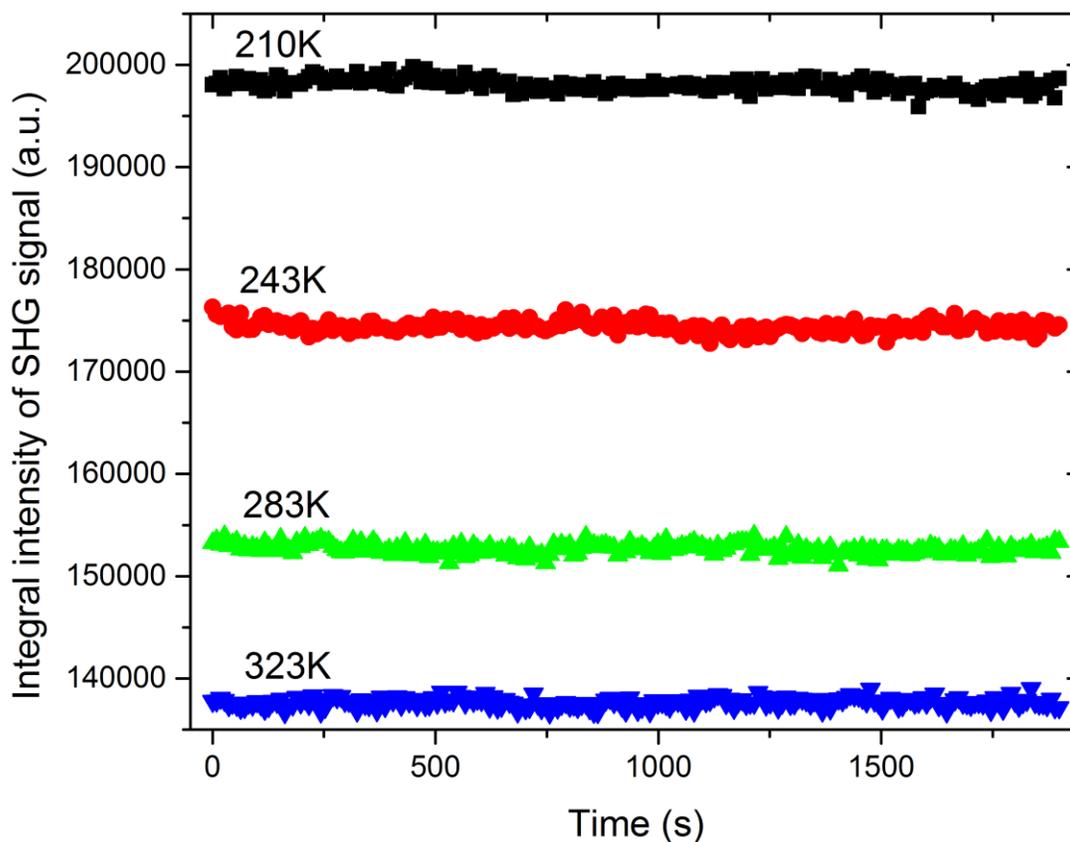

Figure S15. Stability plots of integral intensity of SHG signal in the function of irradiation time for BeTriMeCd registered for four temperature points: 210K, 243K, 283K, and 323K. Each set consists of ca. 220 measurement points which were collected for a period of 30 minutes of laser irradiation. Data shown corresponds is not normalized vs. laser beam intensity, hence the signal ripple is due to minor fluctuation of fundamental beam provided by the femtosecond laser. It is apparent that BeTriMeCd is stable at each of these temperatures for at least 30 minutes of continuous laser irradiation. Laser beam parameters: 800 nm, 75 fs laser pulses at 1kHz repetition rate, 1.3 W/cm² power density.

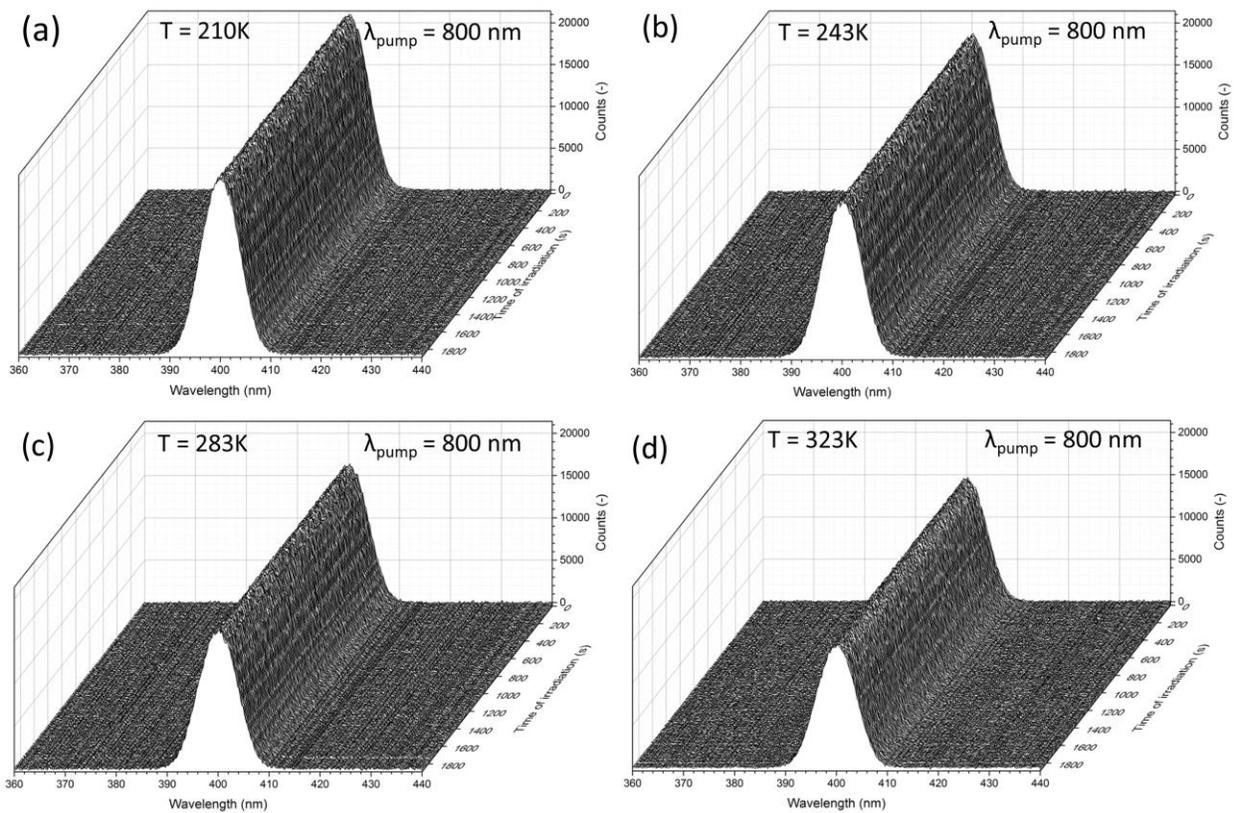

Figure S16. Experimental spectra collected during laser stability experiments at a) 210K, b) 243K, c) 283K, d) 323K.

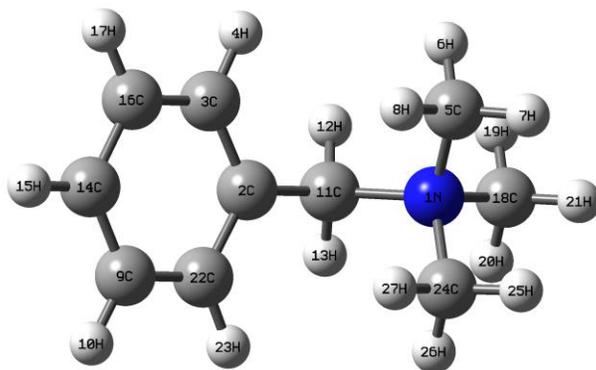

Figure S17. The structural model of the studied BeTriMe^+ cation.

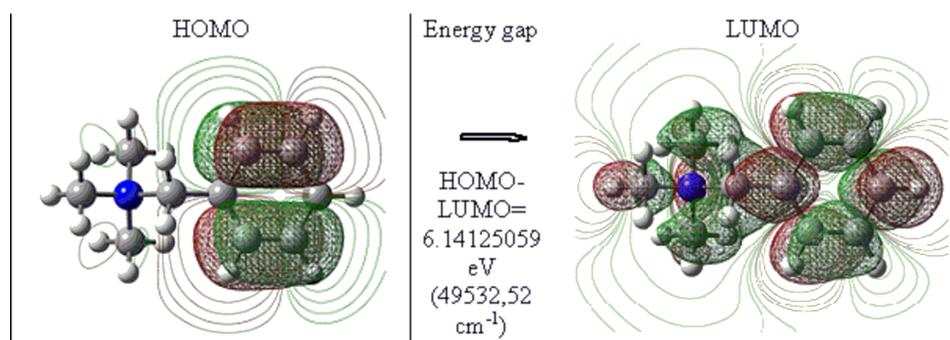

Figure S18. HOMO and LUMO orbitals and the HOMO-LUMO energy gap for the benzyltrimethylamine cation (BeTriMe^+). Detailed values: HOMO(41) = -0,38802 a.u., LUMO(42) = -0,16233 a.u., Energy gap = 0.22569 a.u. (6.14125059 eV, 49532,52 cm^{-1}).

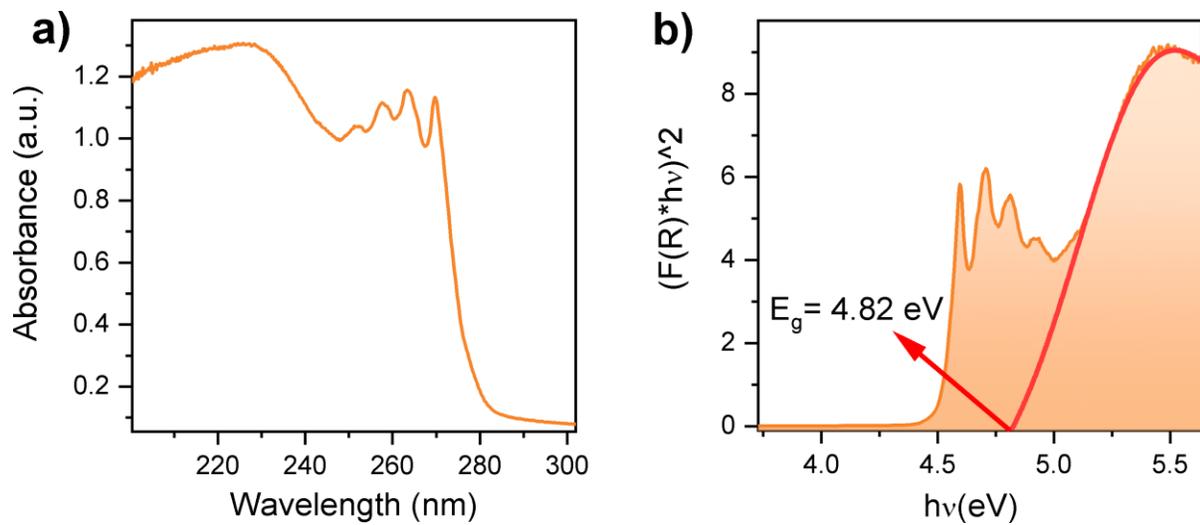

Figure S19. a) The absorbance spectra of BeTriMeCd and b) the energy band gap estimated using Kubelka–Munk function.
