1. Experimental Section

a) General information

¹H NMR (400 MHz), ¹³C NMR (101 MHz) and ¹⁹F NMR (376 MHz) spectra are recorded on a Bruker AV-400 spectrometer in CDCl₃ with TMS as internal standard. For ¹H NMR (400 MHz), CDCl₃ (δ = 7.26 ppm) served as internal standard and data are reported as follows: chemical shift (in ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, brs = broad singlet), coupling constant (in Hz), and integration. GC-MS analysis was performed on 7890A-5975C/Agilent. HR-MS spectra were recorded on a Waters Xevo G2QTOF/UPLC mass spectrometer using TOF as the mass analyzer type.

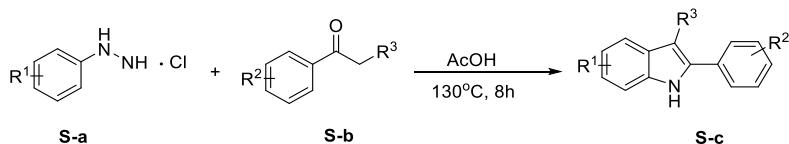

Figure S1. Photoreactor for large-scale reaction

Chemicals were purchased from commercial sources without further purification. Glassware was dried in oven and cooled before use. Solvents were dried and purified according to the procedure from “Purification of Laboratory Chemicals book”. Reactions were monitored by TLC and visualized by UV lamp (254 nm). Yields generally referred to chromatographically isolated yields, unless otherwise noted.

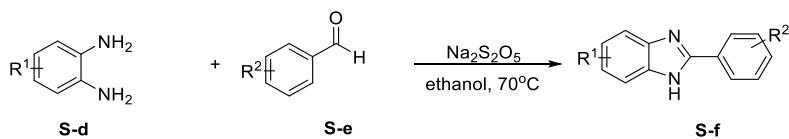

b) Synthesis of starting materials^[1-3]

All the starting materials used in this paper are known compounds. They can be either directly purchased from chemical companies, or easily synthesized through the following procedures.

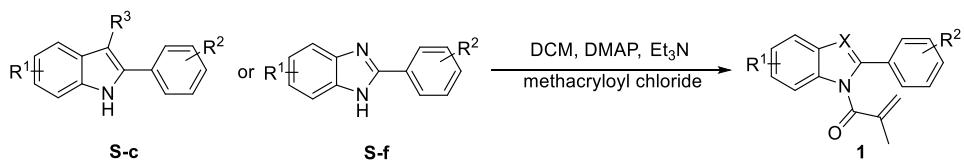

Synthesis of substrate 1:

According to a modified literature procedure¹, a mixture of substituted phenylhydrazine hydrochloride **S-a** (2.0 mmol, 2.0 equiv.) and acetic acid **S-b** was stirred at 50 °C in a 250 mL round-bottomed flask under N₂ atmosphere for 30 minutes, followed by the substituted ketone (1.0 mmol, 1.0 equiv.) was added to a solution was heated to 130 °C for 8 h After completion of the reaction, the reaction mixture was cooled, water was added, and the mixture was allowed to stir in 0 °C to obtain a precipitate. Then, the obtained crude solid indole compounds **S-c** can be directly used in the next synthesis after drying. Sometimes the obtained crude solid should purified by column chromatography to afford indole compound **S-c**.

According to a modified literature procedure², a mixture of substituted o-phenylenediamine **S-d** (1.0 mmol, 1.0 equiv.), Na₂S₂O₅ (1.5 mmol, 1.5 equiv.), and ethanol was stirred at 70 °C in a 250 mL round-bottomed flask under O₂ atmosphere, followed by the substituted benzaldehyde **S-e** (1.0 mmol, 1.0 equiv.) was added to a solution. After completion of the reaction, the reaction mixture was cooled, water was added, and the mixture was allowed to stir in 0 °C to obtain a precipitate. Then, the obtained crude solid benzimidazole compounds **S-f** can be directly used in the next synthesis after drying. Sometimes the obtained crude solid should purified by column chromatography to afford benzimidazole compounds **S-f**.

According to a modified literature procedure³, to the solution of indole **S-c** / **f** (5 mmol, 1 equiv.) and DMAP:4-dimethylaminopyridine (2.0 mmol, 0.4 equiv.) in DCM was added Et₃N (10 mmol, 2.0 equiv.) at 0 °C. Then, methacryloyl chloride (10 mmol, 2.0 equiv.) was slowly dropped into the solution. The solution was warmed up to room temperature after adding methacryloyl chloride and stirred for 2-3 days. The mixture was diluted with DCM (20 mL) and saturated NH₄Cl solution (20 mL). The organic and aqueous layers were separated. The aqueous layer was extracted with DCM (20 mL x 3 times). The combined organic layer was washed with brine, dried over Na₂SO₄, after evaporation of solvent, the crude product **1** was purified by column chromatography on silica gel using petroleum ether/ethyl acetate as eluent.

h) Other plausible reaction mechanisms

On the basis of the reported literatures^[4], t-BuO[•] could self-decompose to give Me[•] and acetone. Me[•] has the ability to abstract halogen to form alkyl radicals. Hence, we suggest another possible reaction mechanism. As shown in Figure S5, in the XAT reaction system, excited Eosin Y promotes the decomposition of TBHP via single-electron-transfer (SET) process to form the 'BuO radical. Then 'BuO radicals continue to self-decompose to give acetone and Me[•] (**B'**). As an important intermediate, Me[•] (**B'**) could abstract halogen from alkyl halides through halogen-atom-transfer (XAT) process, generating the alkyl radical **C**. And the alkyl radical **C** undergoes radical-addition-cyclization cascade to release the final indolo[2,1- α]isoquinoline products **3**.
