1. General Information

NMR Spectra were recorded on a Bruker DPX-500 (400) spectrometer at 500 MHz or 400 MHz for ^1H NMR, 376 MHz for ^{19}F NMR and 100 MHz or 125 MHz for ^{13}C NMR in CDCl_3 with tetramethylsilane (TMS) or the residual deuterated solvent peaks as internal standard. Chemical shifts (δ) are reported in ppm, and coupling constants (J) are in Hertz (Hz). The following abbreviations were used to explain the multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad. Flash column chromatograph was carried out using 200-300 mesh silica gel at medium pressure. High resolution mass spectra (HRMS) were recorded on a LC-TOF spectrometer. ESI-HRMS data were acquired using a Thermo LTQ Orbitrap XL Instrument equipped with an ESI source. Optical rotation was obtained on a Rudolph Research Analytical (Atopol I). HPLC analysis was performed on Agilent 1260 series, UV detection monitored at 254 nm, using a Chiralcel OD-H or AD-H column with hexane and *i*-PrOH as the eluent. Unless otherwise noted, all reagents were purchased from commercial suppliers and used without purification. All air- and moisture-sensitive manipulations were carried out with standard Schlenk techniques under nitrogen or in a glove box under argon. Anhydrous toluene, THF (Tetrahydrofuran) and dioxane were distilled from sodium benzophenone prior to use. Anhydrous DCE and CH_3CN were distilled from calcium hydride and stored under argon. Anhydrous DMF was distilled from calcium hydride under reduced pressure and stored under argon.

2. Procedure for Preparation Chromene and Anthranil derivatives

General procedure for the synthesis of Anthranil derivatives¹⁻⁴

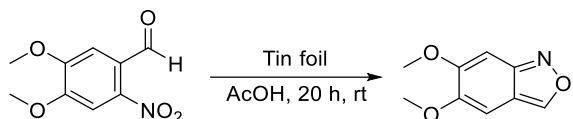

To a solution of 5-chloro-2-nitrobenzaldehyde (10 mmol) in MeOH:EtOAc (20/20 mL) was added SnCl_2 (5.69 g, 30 mmol) at room temperature. The mixture was stirred for 6-24 hours at room temperature before diluting with DCM (100 mL) followed by quenching with saturated aqueous solution of NaHCO_3 . The mixture was passed through short celite bed. The organic phase was separated, washed with brine, dried with Na_2SO_4 and concentrated. The residue was

subjected to silica gel column chromatography using PE/EA (silica gel, 50:1) as eluent to give 6-chlorobenzo[c]isoxazole (**2e**) as white solid.

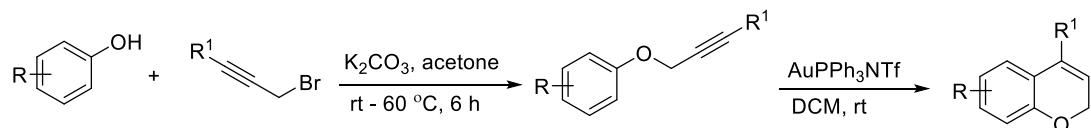

Other anthranils **2d-2j, 2l** were synthesized following similar synthetic procedure. By the way, the method could not give pure **2a-2c,2k** due to acetal which is hard to isolate from anthranils. The pure anthranils were obtained by following method (Sn/AcOH) although in moderate yield.

General procedure for the synthesis of substrates **2a-2c,2k**^{5,6}

Tin foil (1.30 g, 11 mmol) was added in small pieces to a stirred solution of 4,5-dimethoxy-2-nitrobenzaldehyde (500 mg, 2.39 mmol) in glacial acetic acid (15 mL), and the mixture was stirred at room temperature for 20 h and then worked up with ether and water. The organic layer was dried over anhydrous Na₂SO₄, solvent was removed under reduced pressure, and the residue was purified by column chromatography (silica gel, PE/EA (8:2)), affording anthranil **2k** (230 mg, 54 %) in the form of white needles.

A general procedure for the synthesis of 2*H*-chromene **1b-c, 1f-1g, 1i**.⁷

A solution of phenol (5 mmol) was added K₂CO₃ (2 equiv) in acetone. The reaction mixture was stirred at room temperature. After 15 mins, 1.5 equiv of propargyl bromide or 1-bromo-2-butyne were added. The resulting mixture was stirred at 60 °C overnight, and the reaction was stopped by filtration and evaporation under vacuum. The crude product was extracted with ethyl acetate, washed by saturated brine. It was dried over anhydrous Na₂SO₄ and then solvent was removed. The crude product was purified by silica gel chromatography.

To a solution of aryl propargyl ethers (2.5 mmol) in dry CH₂Cl₂ (10 mL) was added Ph₃PAuNTf₂ (19 mg, 1 mol %) at room temperature. After disappearance of the starting material (TLC and/or GC analysis), the reaction was concentrated under vacuum, and the residue was purified by chromatography (hexane/ethyl acetate, 50:1) through a short pad of silica gel to obtain 2*H*-chronenes.⁸

Synthesis of 1a, 1d-e, 1h, 1j-1o. They were prepared according to the reported procedure.⁸

3. General Procedural Information and Optimization of Hydroamination

Typical Reaction Conditions for Synthesis of Chiral Amine.

A flame-dried pressure tube (15 mL) equipped with a magnetic stir barr (10 mm × 5 mm, egg shaped) was evacuated and filled Ar for three times before being transferred into a glovebox. CuOAc (0.01 mmol, 5 mol %), (*S,S*)-(Ph-BPE) (0.011 mmol, 5.5 mol %) and dry toluene (1 mL) was added to the tube stirring for 10 min. PhSiH₃ (50 µL, 0.4 mmol, 2 equiv) was then added. This mixture was stirred for 30 min as a homogenous solution formed. At this time, chromene substrate (0.2 mmol, 1 equiv), fresh anthranil substrate (0.3 mmol, 1.5 equiv) and *t*-BuOH (0.4 mmol, 2 equiv) were added in succession. The reaction tube was capped and taken out of the glovebox. The reaction was stirred at room temperature for 3-12 h. After completion by TLC, a saturated solution of NH₄F in MeOH (ca. 3 mL) was carefully added to quench the reaction (Caution: gas evolution was observed). The reaction mixture was allowed to stir at room temperature for 15 min before diluted with DCM (ca. 10 mL) and water (5mL). The organic phase was separated and the aqueous layer was extracted with DCM (10mL*2). The combined organic phase was concentrated in *vacuo* and the residue was purified by silica gel chromatography using PE/EA (silica gel, 10:1 to 5:1) with 1% Et₃N to afford the product.
