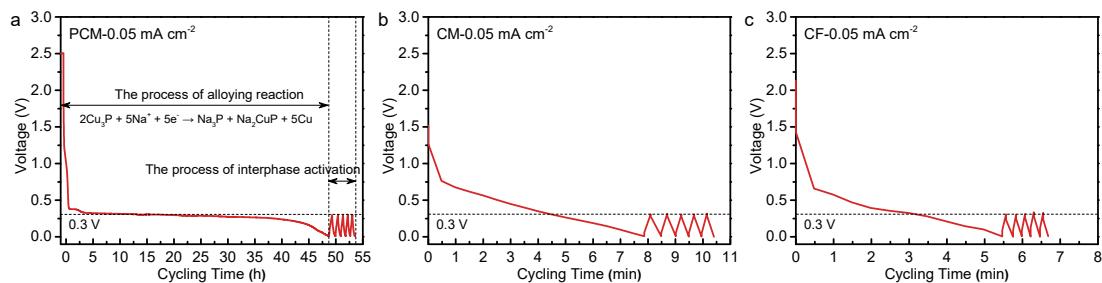

**Fig. S1.** XPS spectra of PCM electrode. (a) Cu 2p, (b) P 2p.

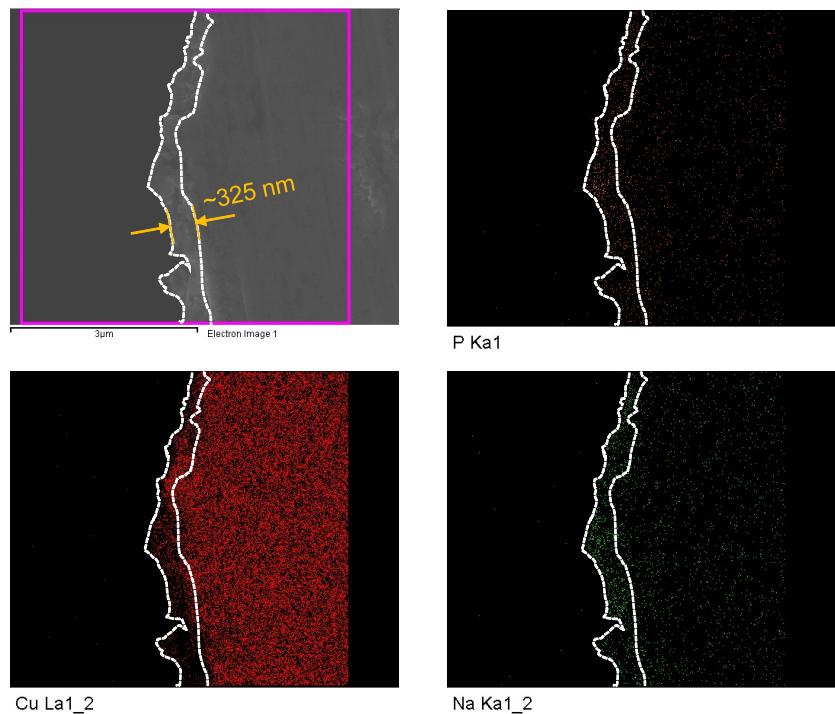

**Fig. S2.** The EDS analysis of PCM electrode.

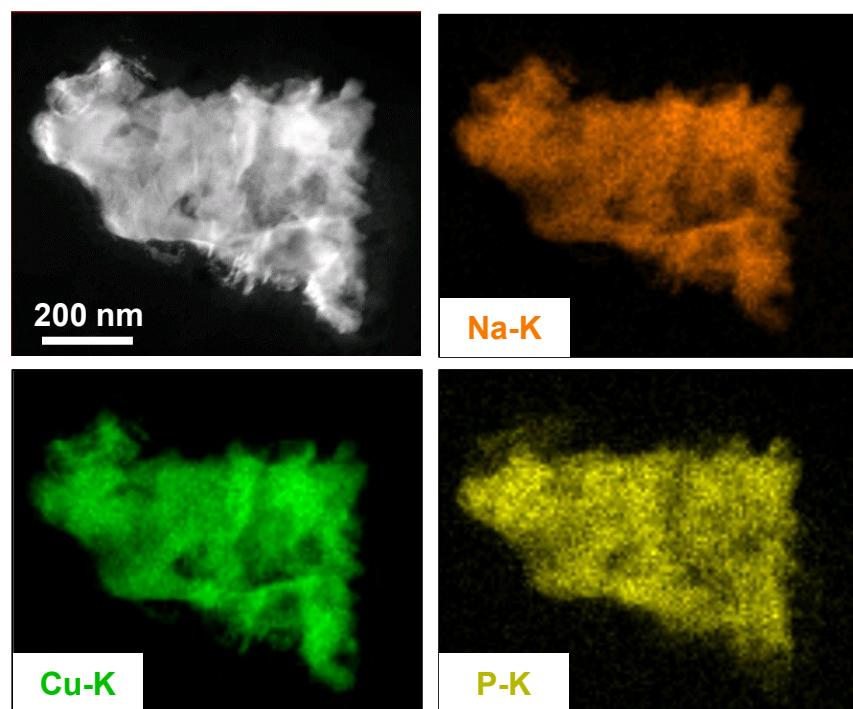

**Fig. S3. The EDX mapping of PCM electrode.**

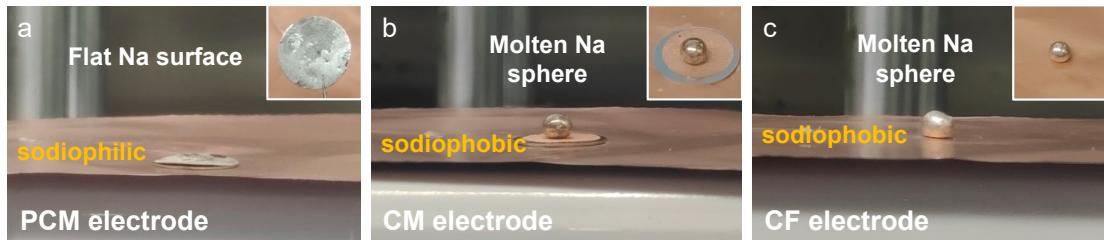

**Fig. S4. Voltage-time plots of various electrodes after initial discharge to 0.01 V at a current density of 0.05 mA cm<sup>-2</sup>.** (a) PCM electrode, (b) CM electrode and (c) CF electrode.

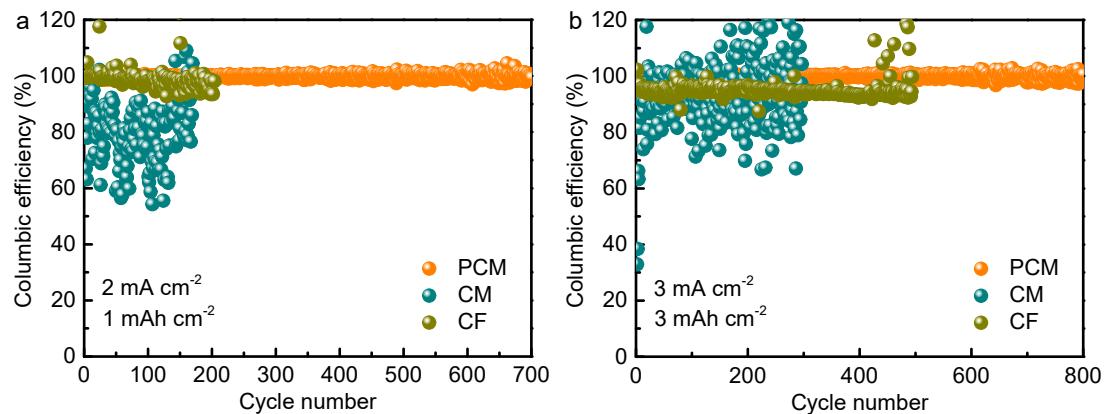

**Fig. S5.** The side-view SEM image and EDX mapping of PCM electrode when discharged to 0.01 V.

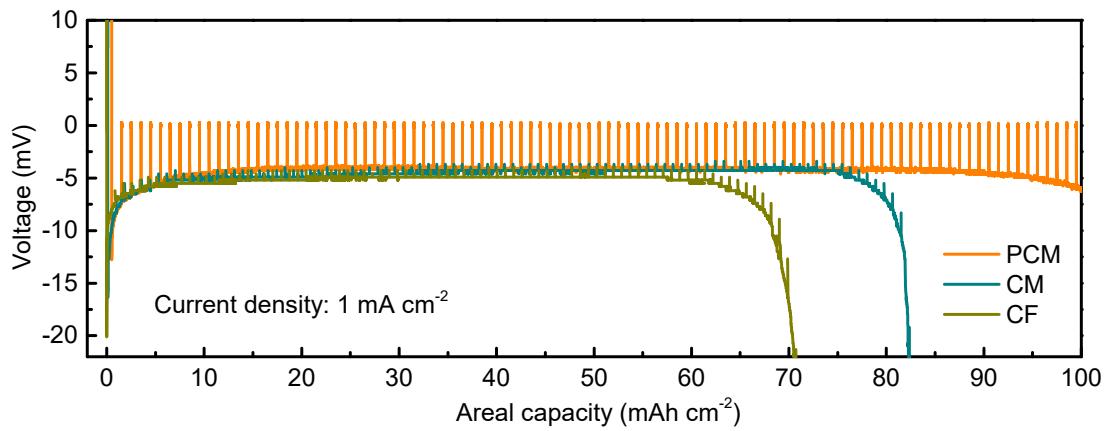

**Fig. S6.** The HAADF-STEM image and elemental mapping of PCM electrode when discharged to 0.01 V.

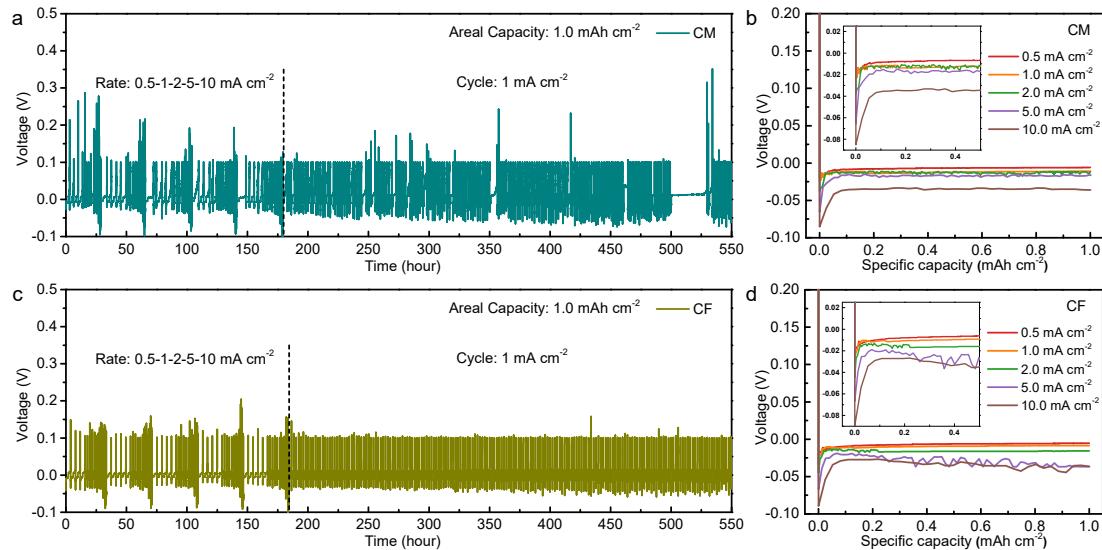

**Fig. S7. The side/top-view optical physical image of molten sodium on different substrates:** (a) PCM electrode, (b) CM electrode and (c) CF electrode. Owing to Cu<sub>3</sub>P can react with Na at high temperature (the temperature is set to 200 °C), which promotes the spontaneous reaction and molten-sodium is continuously attracted until the phosphorized copper mesh is completely infiltrated. The whole process of sodium metal melting and infusing were carried out in a glove box filled with argon (the content of O<sub>2</sub> and H<sub>2</sub>O were kept below 0.1 ppm). Furthermore, the specific process of sodium metal melting and infusing as shown in **Supplementary Video 1** and **Video 2**.

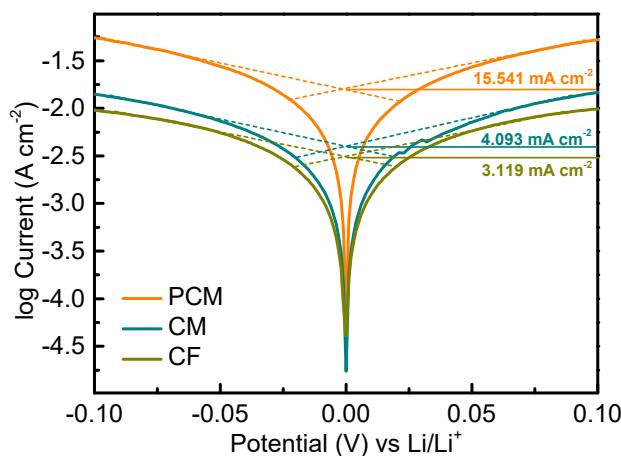

**Fig. S8. Electrochemical cycling stability characterization of PCM, CM and CF electrodes in half-cell.** (a) 2 mA cm<sup>-2</sup>-1 mAh cm<sup>-2</sup>. (b) 3 mA cm<sup>-2</sup>-3 mAh cm<sup>-2</sup>.

**Fig. S9. Voltage-capacity curves of PCM, CM and CF electrodes during GITT test at a current density of  $1 \text{ mA cm}^{-2}$ .**

**Fig. S10. Electrochemical rate performance characterization at various current density from 0.5 to 10  $\text{mA cm}^{-2}$  in half-cell.** The voltage-time profiles of (a) CM electrode and (c) CF electrode. The voltage-capacity curves of (b) CM electrode and (d) CF electrode.

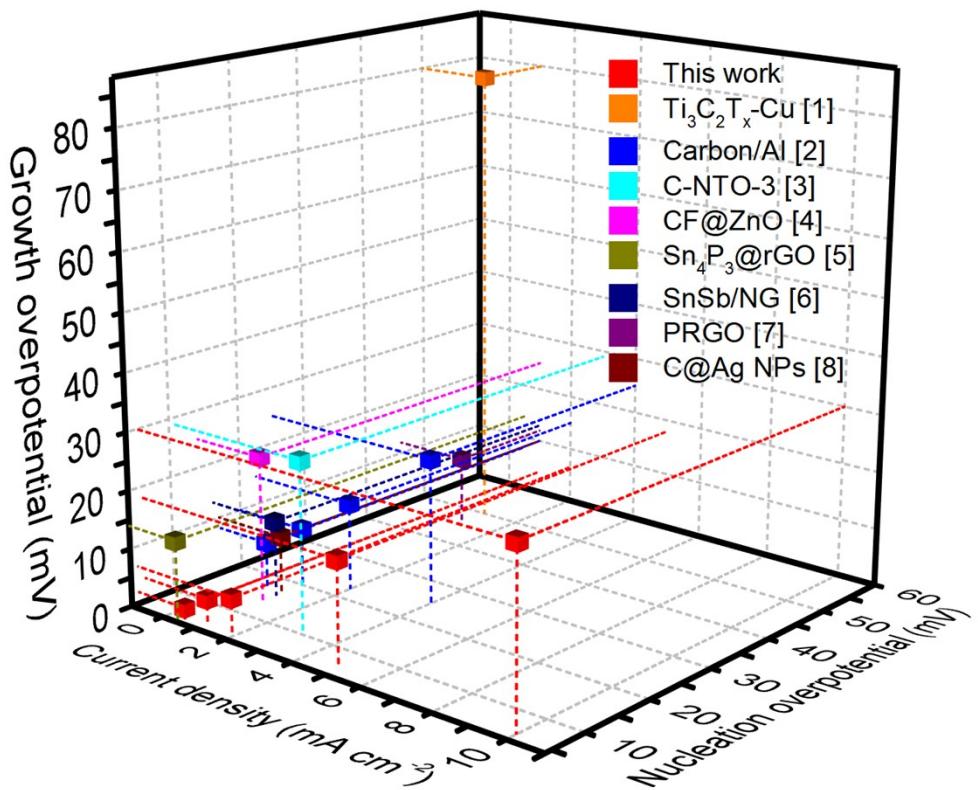

**Fig. S11.** Tafel curves of PCM, CM and CF electrodes.

**Table S1.** The corresponding value of electrodeposition overpotential of PCM, CM and CF electrodes under various current density from 0.5 to 10  $\text{mA cm}^{-2}$  in half-cell.

| Current Collector | Potential (mV) | 0.5 $\text{mA cm}^{-2}$ | 1 $\text{mA cm}^{-2}$ | 2 $\text{mA cm}^{-2}$ | 5 $\text{mA cm}^{-2}$ | 10 $\text{mA cm}^{-2}$ |

**Table S3.** The Equivalent Circuit Fitting results of EIS measurements of PCM, CM and CF electrodes.

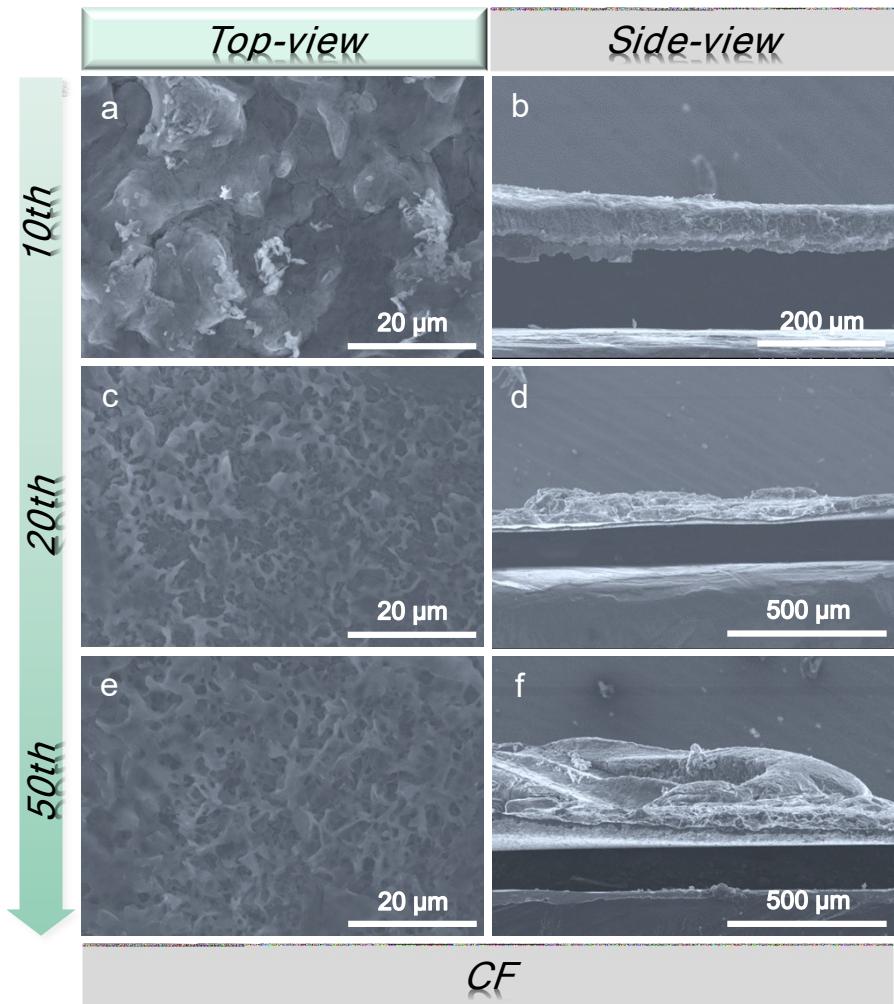

| Current Collector | Cycle                | $R_e(\Omega)$ | $R_{SEI}(\Omega)$ | $R_{ct}(\Omega)$ |
|-------------------|----------------------|---------------|-------------------|------------------|
| PCM               | After the 1st cycle  | 2.09          | 0.75              | 1.43             |
|                   | After the 10th cycle | 1.91          | 0.29              | 1.04             |
|                   | After the 50th cycle | 1.72          | 0.28              | 0.99             |
| CM                | After the 1st cycle  | 1.82          | 0.62              | 1.52             |
|                   | After the 10th cycle | 1.81          | 0.38              | 1.12             |
|                   | After the 50th cycle | 2.10          | 0.63              | 1.59             |
| CF                | After the 1st cycle  | 2.13          | 0.87              | 0.45             |
|                   | After the 10th cycle | 2.05          | 0.23              | 1.56             |
|                   | After the 50th cycle | 2.10          | 0.29              | 1.69             |

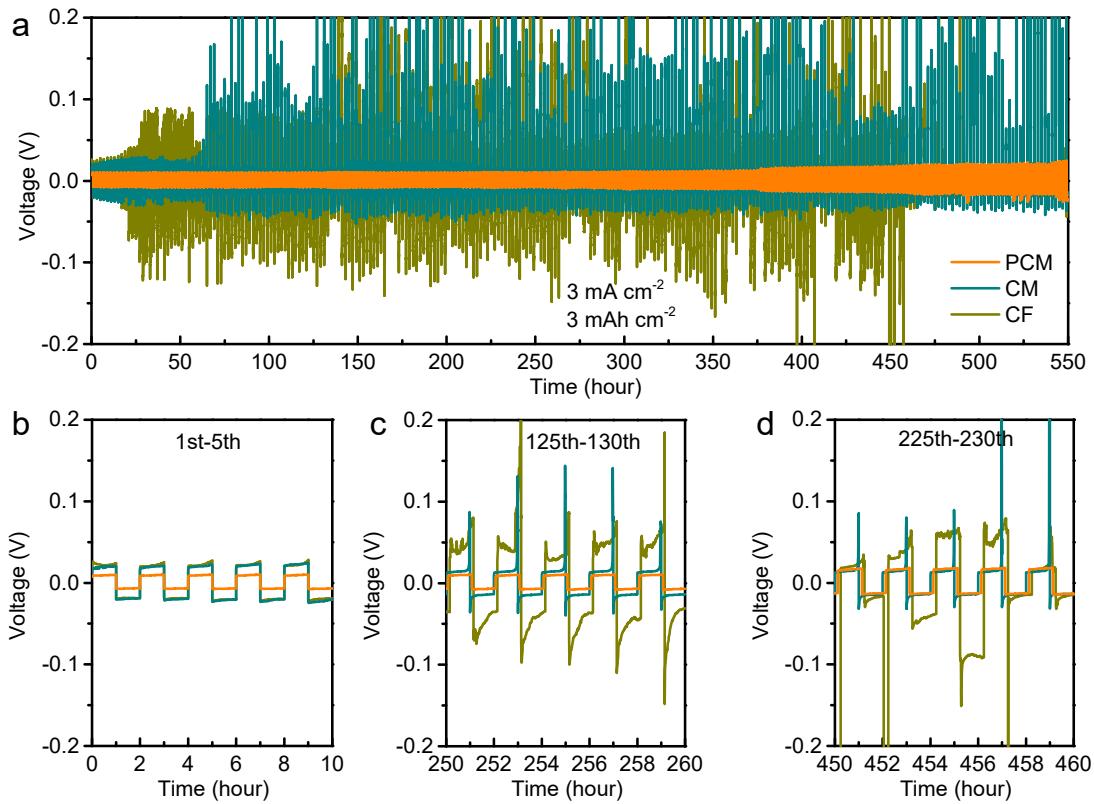

**Fig. S15. High magnification top-view and side-view SEM images of deposited Na for after various cycles at  $1 \text{ mA cm}^{-2}$ - $1 \text{ mAh cm}^{-2}$  on PCM electrode. (a-b) 10th cycle (c-d) 20th cycle and (e-f) 50th cycle.**

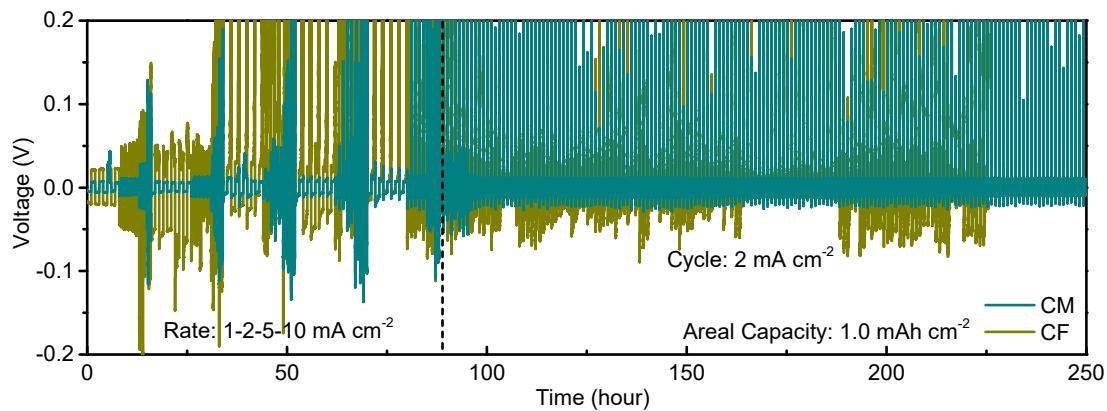

**Fig. S16. High magnification top-view and side-view SEM images of deposited Na for after various cycles at  $1 \text{ mA cm}^{-2}$ - $1 \text{ mAh cm}^{-2}$  on CM electrode. (a-b) 10th cycle (c-d) 20th cycle and (e-f) 50th cycle.**

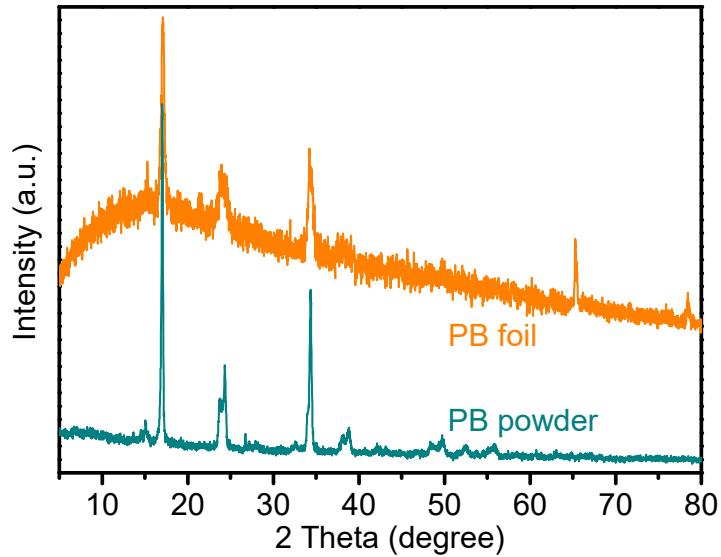

**Fig. S17. High magnification top-view and side-view SEM images of deposited Na for after various cycles at  $1 \text{ mA cm}^{-2}$ - $1 \text{ mAh cm}^{-2}$  on CF electrode. (a-b) 10th cycle (c-d) 20th cycle and (e-f) 50th cycle.**

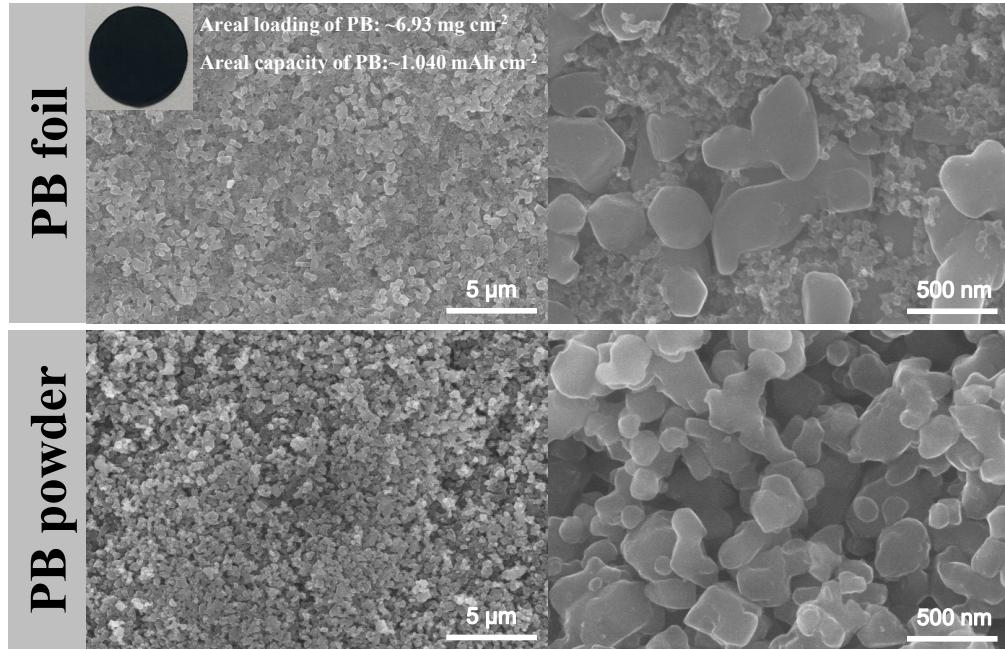

**Fig. S18. Electrochemical long-term cycling performance of symmetric-cell.** (a) The rate capabilities of PCM@Na||PCM@Na, CM@Na||CM@Na, CF@Na||CF@Na symmetric-cell at 3  $\text{mA cm}^{-2}$ -3  $\text{mAh cm}^{-2}$ . Magnified voltage-time profiles of (a) during (b) 0~10 h; (c) 250~260 h; (d) 450~460 h.

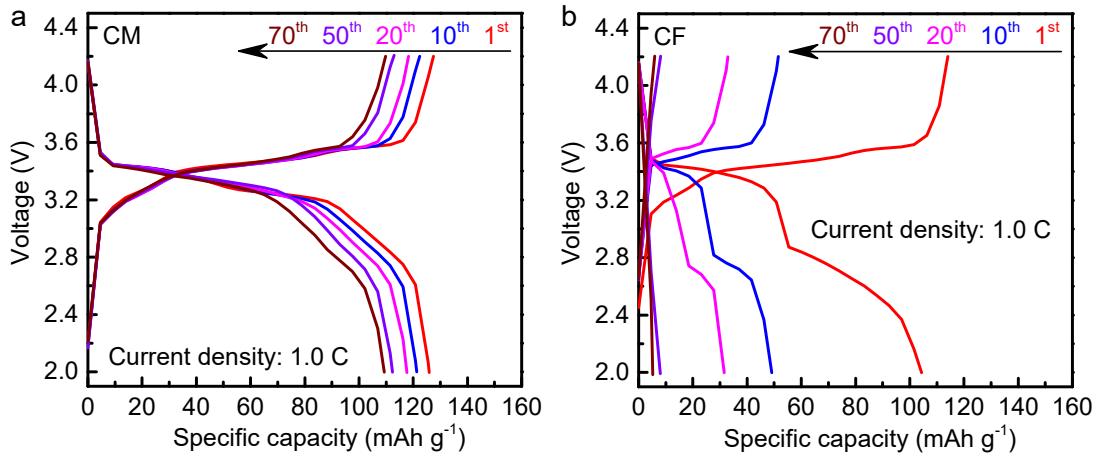

**Fig. S19. Electrochemical rate capabilities performance of CM@Na||CM@Na, CF@Na||CF@Na symmetric-cell.**

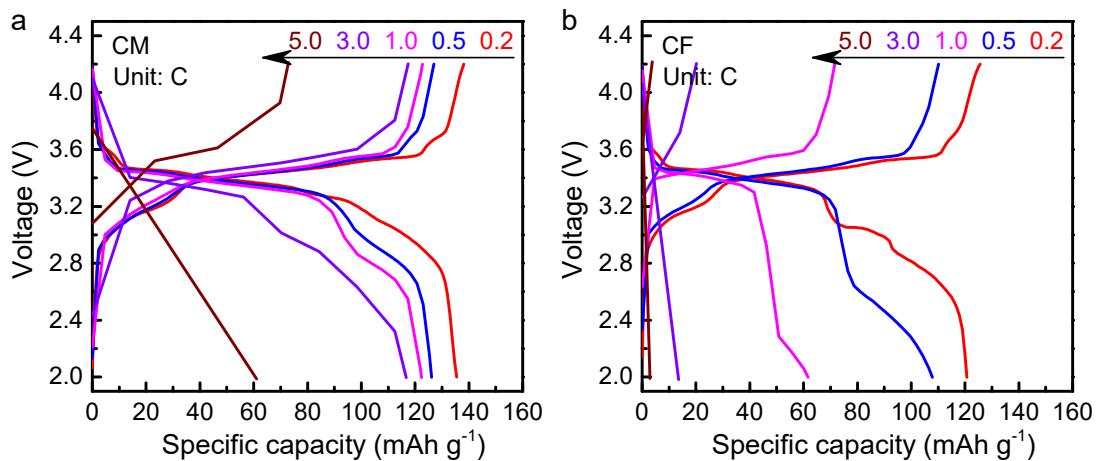

**Fig. S20. The XRD patterns of Prussian blue (PB) power and aluminum foil with PB (i.e. PB foil).** The alignment of the peak positions indicates that the PB remains unchanged after being slurried and coated on the aluminum foil.

**Fig. S21. The SEM images of Prussian blue (PB) power and aluminum foil with PB (i.e. PB foil).** Among them, the morphology of PB remains unchanged after being slurried and coated on the aluminum foil. For PB foil, the areal loading of PB is about  $6.93 \text{ mg cm}^{-2}$ .

**Fig. S22. The various selected voltage-capacity curves of (a) CM@Na||PB and (b) CF@Na||PB full-cell.**

**Fig. S23. The selected voltage-capacity curves of (a) CM@Na||PB and (b) CF@Na||PB full-cell at different rates.**

**Fig. S24.** LED lights (48 pcs) powered by one PCM@Na||PB full-cell for 5 s, 1 min, 5 min, 10 min, 15 min and 20 min.
