## General experimental procedures, materiales and instruments

All reagents were used as purchased from commercial suppliers without further purification. The reactions were carried out in oven dried vessels. Solvents were dried and purified by conventional methods prior use or, if available, purchased in anhydrous form. Flash column chromatography was performed with Merck silica gel 60, 0.040-0.063 mm (230-400 mesh). MPLC Syncore® Büchi on highly resistant PP cartridges Normal Phase silica gel NP $40-63 \mu \mathrm{~m}$ particle size and 60 A pore size (Si60) withstand a maximum pressure of $10 \mathrm{bar}(145 \mathrm{psi})$ column with petroleum ethet (eluent A$)$ and Ethyl Acetate (Eluent B) as mobile phase. Merck aluminum backed plates pre-coated with silica gel 60 (UV254) were used for analytical thin layer chromatography and were visualized by staining with a $\mathrm{KMnO}_{4}$ solution. NMR spectra were recorded at $25^{\circ} \mathrm{C}$ or at $37^{\circ} \mathrm{C}$ and 400 or 600 MHz for 1 H and 101 or 151 MHz for 13C Brücker Advance NMR spectrometers. The solvent is specified for each spectrum. Splitting patterns are designated as $s$, singlet; d, doublet; $t$, triplet; $q$, quartet; m, multiplet; bs, broad singlet. Chemical shifts (d) are given in ppm relative to the resonance of their respective residual solvent peaks. High and low resolution mass spectroscopy analyses were recorded by electrospray ionization with a mass spectrometer Q-exactive Plus. HPLC analysis were performed on a LC/MSD system InfinityLab LC/MSD iQ, Method: Column: InfinityLab PoroShell 120 EC-C18 2.1x50mmx2.7 m . Flow: $0.4 \mathrm{~mL} / \mathrm{min}$. Eluent A/B: $\mathrm{H}_{2} \mathrm{O} / \mathrm{MeCN}$. Gradient: $5 \%$ B to $95 \%$ B in 10 minutes, 4 minutes at $95 \%$ B and 3 minutes of re-equilibration. Detection: 254 nm and 210 nm .

## HPLC method for hydrolysis

Samples were prepared according to literature. ${ }^{1}$
A 10 mM solution of the desired compound $(\mathbf{8}, \mathbf{1 1}, \mathbf{1 5}, \mathbf{1 8})$ was prepared in DMSO and diluted in $\mathrm{H}_{2} \mathrm{O}$ or the corresponding buffer to obtain a 1 mM solution. For $\mathrm{pH} 7.4,6.5,5.5$, phosphate buffers 0.1 M were used $\left(\mathrm{KH}_{2} \mathrm{PO}_{4} / \mathrm{K}_{2} \mathrm{HPO}_{4}\right)$. Each solution was analyzed by analytical HPLC (conditions mention above). Compounds 8, 11, 15, 18 were mixed with the buffers at $25^{\circ} \mathrm{C}$ and further incubated at $37^{\circ} \mathrm{C}$. Injections were carried out every 3 h up to 48 h . All data were recorded in triplicate.

## MALDI analysis of bioconjugates

The matrix solutions were prepared at two different concentrations, and both were used in parallel with the same sample: 20.0 mg or 25 mg of Super DHB were dissolved in a solution of $150 \mu \mathrm{l}$ of $\mathrm{MeCN}, 350 \mu \mathrm{l}$ of $\mathrm{H}_{2} \mathrm{O}$ and $0.05 \mu \mathrm{l}$ of TFA.

Usually, the matrix solutions were prepared the day before the deposition and conserved and room temperature. The stainless-steel target was placed in a termoblock setting to $39^{\circ} \mathrm{C}$ and then $1.35 \mu \mathrm{l}$ of the sample was deposited using a micropipette. After the evaporation of the solvent and when the sample was dried, $1.65 \mu \mathrm{l}$ of matrix solution was deposited. The formation of the crystal, at this plate temperature, requires about 3-5 minutes. Once it was completely dried, it was possible remove the target from the termoblock.

To acquire the sample spectra, the target plate was inserted into the MALDI-TOF instrument and appropriate instrumental parameters were chosen. In this case, the instrument was used in linear mode (not in reflector mode) and was set at $83 \%$ of laser intensity. The $\mathrm{m} / \mathrm{z}$ range was from 30 kDa to 200 kDa.

For each sample spot, 10 shots were acquired, to improve the spectra quality and mass accuracy. DAR was calculated dividing the difference between the ADC and the free antibody with the payload mass. Calculation was done on the mono-charged and double-charged peaks and the DAR expressed as medium value.

## General procedure for preparation of ADCs. 21 (Ctx-NH-17), 22 (Ctx-NH-19)

The proper carboxylic acid ( $28 \mu \mathrm{~L}, 10 \mathrm{mM}$ in DMSO) was activated by adding S-NHS ( $5 \mu \mathrm{~L}, 100$ mM in mQ water $)$ and $\operatorname{EDC}(5 \mu \mathrm{~L}, 100 \mathrm{mM}$ in mQ water $)$. The reaction was left for 16 at rt PBS pH $7.4(35 \mu \mathrm{~L})$ and Cetuximab freshly dialyzed using a 10 kDa cutoff dialysis membrane ( $100 \mu \mathrm{~L}, 5$ $\mathrm{mg} / \mathrm{mL}$ in PBS pH 7.4 ) were added to the activated carboxylic acid solution. The reaction was incubated at rt and after 1 h quenched with a 20 mM glycine acqueous solution $(27 \mu \mathrm{~L})$. The final product ( $\mathbf{2 0}, \mathbf{2 1}$ ) was purified using PD spintrap ${ }^{\mathrm{TM}}$ G- 25 column removing the unreacted excess of small molecules.

## Stability in Human Plasma

Pooled human plasma, purchased from Merck ( $0.9 \mathrm{~mL}, 55.7 \mu \mathrm{~g}$ protein $/ \mathrm{mL}$ ), ${ }^{7}$ hepes buffer ( 1.0 mL , $25 \mathrm{mM}, \mathrm{NaCl} 140 \mathrm{mM}, \mathrm{pH} 7.4$ ) and tested compound dissolved in DMSO ( $100 \mu \mathrm{~L}, 2.0 \mathrm{mM}$ ) were mixed in a test tube that was incubated at $37^{\circ} \mathrm{C}$ under continuous mechanical agitation. At set time points ( $0.0,0.25,0.50,1.0,3.0,5.0,8.0$, and 24.0 h ), samples of $100 \mu \mathrm{~L}$ were taken, mixed with 400 $\mu \mathrm{L}$ of cold acetonitrile and centrifuged at 5000 rpm for $15 \mathrm{~min} .{ }^{8}$ The supernatant was collected and analyzed by UV/LC-MS to monitor the amount of unmodified compound. For each compound, the determination was performed in three independent experiments.

## UV/LC-MS methods

LC analyses of plasma stability tests were performed by using Agilent 1100 LC/MSD VL system (G1946C) (Agilent Technologies, Palo Alto, CA) constituted by a vacuum solvent degassing unit, a binary high-pressure gradient pump, an 1100 series UV detector, and an 1100 MSD model VL benchtop mass spectrometer. MSD single-quadrupole instrument was equipped with the orthogonal spray API-ES (Agilent Technologies, Palo Alto, CA). The pressure of the nebulizing gas and the flow of the drying gas (nitrogen used for both) were set at $40 \mathrm{psi}, 9 \mathrm{~L} / \mathrm{min}$, respectively. The capillary voltage, the fragmentor voltage, and the vaporization temperature were $3000 \mathrm{~V}, 10 \mathrm{~V}$, and $350{ }^{\circ} \mathrm{C}$, respectively. MSD was used in the positive and negative ion mode. Spectra were acquired over the scan range $\mathrm{m} / \mathrm{z}$ 100-2000 using a step size of 0.1. Chromatographic analyses were performed using a Phenomenex Kinetex EVO C18-100 $\AA(150 \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$ particle size) at room temperature, at flow rate of $0.6 \mathrm{~mL} / \mathrm{min}$, and injection volume of $10 \mu \mathrm{~L}$, operating with a gradient elution of A: water (H2O) and B: acetonitrile (ACN). Both solvents were acidified with $0.1 \% \mathrm{v} / \mathrm{v}$ of formic acid. UV detection was monitored at 254 nm . The analysis started with $0 \%$ of B, then B was increased to $80 \%$ (from $t=0$ to $t=20 \mathrm{~min}$ ), then kept at $80 \%$ (from $t=20$ to $t=25 \mathrm{~min}$ ) and finally return to $0 \%$ of eluent $B$ in 5.0 min .

## Cell culture

A431 epidermoid carcinoma cells and A549 lung carcinoma cells (ATCC, Rockville, MD, USA) were cultured in DMEM (Euroclone) supplemented with 10\% fetal bovine serum (FBS, Euroclone), $100 \mathrm{U} / \mathrm{ml}$ penicillin/streptomycin (Euroclone), and $4 \mathrm{mM} \mathrm{L-glutamine} \mathrm{(Euroclone)}$. were grown at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$.

## MTT assay

$2.5 \times 10^{3}$ cells/well were seeded in 96-multiwell plates in medium $10 \%$ FBS. After adherence, cells were incubated in fresh medium with increasing concentrations of doxorubicin (0.05-50 $\mu \mathrm{M}$ ), Combretastatin A4 (0.1-100 $\mu \mathrm{M}$ ), Cetuximab ( $0.1-10 \mu \mathrm{~g} / \mathrm{ml}$ ), $21(0.1-10 \mu \mathrm{~g} / \mathrm{ml})$ and $22(0.1-10$ $\mu \mathrm{g} / \mathrm{ml})$. At the indicated time ( $24,48,72$ and 96 h ) the medium was removed, and cells were incubated for 4 h with fresh medium in the presence of 1.2 mM MTT (3-(4,5-dimethylthiazol-2-yl)-2,5diphenyltetrazolium bromide) (Sigma-Aldrich). The MTT solution was then removed and $50 \mu \mathrm{~L}$ of DMSO were added to each well to dissolve the blue formazan crystals. The absorbance of the formazan dye was measured at 570 nm with a microplate reader (EnVision, PerkinElmer, Waltham, MA, USA). Data were expressed as a percentage of the basal control.

## Apoptosis assay with DAPI stain

A431 and A549 cell ( $3 \times 10^{3}$ cells/well) were seeded in 96 -well plates. After 24 h , cells were treated with doxorubicin (10 $\mu \mathrm{M}$ ), combretastatin A4 (10 $\mu \mathrm{M}$ ), $21(10 \mu \mathrm{~g} / \mathrm{mL}), \mathbf{2 2}(10 \mu \mathrm{~g} / \mathrm{mL})$, and cetuximab $(10 \mu \mathrm{~g} / \mathrm{mL})$ for 48 h . Then cells were fixed with paraformaldehyde for 20 min and stained with DAPI ( $100 \mathrm{ng} / \mathrm{mL}$ ) (Cell Signaling) for 5 min . Cell nuclei were photographed by a fluorescence microscope (Nikon, Eclipse Ts2).

## Annnexin V-FITC/PI assay

A431 and A549 cell ( $8 \times 10^{4}$ cells/well) were seeded in 24 -well plates with glass cover-slips for 24 h. Then cells were treated for 18 h with doxorubicin $(10 \mu \mathrm{M})$, combretastatin A4 $(10 \mu \mathrm{M}), 21(10$ $\mu \mathrm{g} / \mathrm{mL}), 22(10 \mu \mathrm{~g} / \mathrm{mL})$ and cetuximab $(10 \mu \mathrm{~g} / \mathrm{mL})$. Subsequently, apoptosis was monitored by a fluorescence microscope (Nikon, Eclipse Ts2), using an Annexin V-FITC Early Apoptosis Detection Kit (Cell Signaling).

## Statistical analysis

Data were generated from three independent experiments and expressed as means $\pm$ standard deviation (SD). Statistical analysis was performed using Student's $t$ test for unpaired data; $p<0.05$ was considered statistically significant.
