General Information

All reagents and solvents were of the commercial reagent grade and were used without further purification unless otherwise noted. [Pt(II)(bpy)Cl₂] was prepared according to literature method¹. Dry MeOH was obtained by distillation over calcium hydride. Tetrahydrofuran (THF) was distilled from sodium benzophenone ketyl under a nitrogen atmosphere prior to use. CH₂Cl₂ and Toluene were distilled from CaH₂. CH₃CN for spectroscopy was purchased from Kanto Chemical co., inc. Solvent for PL and PL quantum yield measurements were deaerated by freeze degassing. ¹H and ¹³C NMR spectra were recorded on a BRUKER AVANCE III 500 at 25 °C in *d*₆-DMSO. ¹H NMR chemical shifts are expressed in parts per million (δ) relative to trimethylsilane (TMS) as a reference. Matrix-assisted laser desorption ionization-time of flight (MALDI-TOF) mass spectroscopy (MS) spectra were recorded with a AB SCIEX 4800 MALDI TOF/ TOF analyzer, using 1,8-dihydroxy-9[10*H*]-anthracenone (dithranol) as the matrix.

Spectroscopy

UV-vis absorption spectra of CH₃CN solutions (1.0×10^{-5} M) and PMMA films were recorded with JASCO V-570 UV/VIS/NIR spectrometer. CD spectra of CH₃CN solutions (1.0×10^{-5} M) and PMMA films were recorded with JASCO J-720W spectrometer. Photoluminescence (PL) spectra of CH₃CN, CH₂Cl₂, toluene, and THF solutions (1.0×10^{-5} M), THF-water mixed solutions (1.0×10^{-4} M), solid state (powder samples) and PMMA films were acquired using JASCO FP-8600 spectrometer in air at room temperature, at excitation wavelength of 250 nm (solutions), 400 nm (powder samples and THF-water mixed solutions), and 380 nm (PMMA films). CPL spectra of THF-water mixed solutions (1.0×10^{-4} M), powders and PMMA films were measured with a JASCO CPL-300 spectrofluoropolarimeter at room temperature, at a scattering angle of 0° upon excitation with unpolarized, monochromated incident light with a 10 nm bandwidth for the PMMA films and 100 nm bandwidth for the powder samples. Absolute PL quantum yields of powders and PMMA films were determined using a JASCO PF-6500 spectrometer with an integrating sphere (JASCO ILF-533, diameter 96 mm) at excitation wavelength of 500 nm (powder samples) and 380 nm (PMMA films). The measurement of quantum yields of powder samples was performed by using KBr plates. Powders were placed between KBr plates and pressure of 20 MPa was applied. Fluorescence/Phosphorescence lifetimes were measured for powder samples and PMMA films with a HORIBA DeltaFlex spectrometer with a 370 nm LED light source for excitation. A colloidal silica suspension in water was used as a scatterer to determine the instrumental response. Dynamic light scattering spectra were measured for THF-water mixed solution ($f_w = 95\%$) with Zetasizer Nano Series ZEN3600. For the optical measurements of solutions, a conventional 1 cm quartz cell was used.

Preparation of powder samples and PMMA films for the spectroscopy

Solid state samples (powder samples) for the spectroscopic measurements were prepared by dropping the MeOH suspension of the Pt complex on the glass substrate. The MeOH solvent was allowed to evaporate spontaneously. Samples dispersed in PMMA films were prepared by casting CHCl₃ solution of the Pt complex on the glass substrate. The ratio of the Pt complex to PMMA was 1 wt%, 2 wt% and 5 wt%, and the concentration of the Pt complex in CHCl₃ solution of PMMA/Pt complex was 0.63 M (1 wt%), 1.25 M (2 wt%) and 3.14 M (5 wt%). Thickness of the PMMA film was 160 μm for **S-Pt** and 190 μm for **R-Pt**.

X-ray Crystallography

Single crystals of **R-** and **S-Pt** were mounted on a glass fiber with paratone oil. Diffraction data were collected at 100 K on a Bruker SMART APEX II diffractometer fitted with a CCD-type area detector, and a full sphere of data was collected using graphite-monochromated Mo K α radiation ($\lambda = 0.71073$ Å). Data frames were integrated with the Bruker SMART APEX III software and merged to give a unique data set for structure analysis. Numerical absorption correction by integration was applied on the basis of measured indexed crystal faces using SADABS program. The structures were solved by direct methods and refined by the full-matrix least-squares method on F^2 data with the SHELXL-2016/6 package. All non-hydrogen atoms were refined with anisotropic thermal parameters. Hydrogen atoms were included in calculated positions and refined with isotropic thermal parameters riding on those of the parent atoms. Crystallographic data and structure refinement details are listed in Table S1.

Theoretical calculation

All calculations were performed by using Gaussian 16 rev C.01 program package.² The initial geometry was taken from the X-ray crystal structure analysis and optimized by the density functional theory (DFT) at the level of CAM-B3LYP/Def2SVP for all atoms with the conductor-like polarizable continuum model (CPCM) to consider the solvent (CH₃CN). The time-dependent density functional theory (TD-DFT) calculation for **R-Pt** was conducted at the level of CAM-B3LYP/Def2SVP for all atoms with the conductor-like polarizable continuum model (CPCM) to consider the solvent (CH₃CN). The UV-vis absorption spectrum of **R-Pt** was simulated based on the 200 of the calculated oscillation strengths with Gaussian distribution with a bandwidth of 0.33 eV, and the spectrum was shifted by –0.29 eV to compensate the error of the CAM-B3LYP functional. The CD spectrum of **R-Pt** was also simulated based on the 200 of the calculated rotational strengths with Gaussian distribution with a bandwidth of 0.24 eV, and the spectrum was shifted by –0.29 eV to compensate the error of the CAM-B3LYP functional. Representative calculated singlet vertical excitation energies with relatively large oscillation strengths in acetonitrile are summarized in Table S3 and corresponding molecular orbitals are depicted in Fig. S22.

General procedure for synthesis of *R*- and *S*-Pt

The synthesis of ***R*-Pt** is representative. A mixture of [Pt(II)(bpy)Cl₂] (102 mg, 0.24mmol), (*R*)-BINOL (74 mg, 0.25 mmol), and K₂CO₃ (72 mg, 0.52 mmol) in methanol (20 ml) was refluxed under nitrogen atmosphere for overnight. After filtration of the resulting reddish solution through Celite, the filtrate was concentrated in vacuo. Purification of the product with silica gel column chromatography by using CHCl₃-MeOH (9 : 1) as an eluent, and then slow evaporation of CHCl₃ from the solution gave 52 mg (0.082 mmol) (34% yield) of ***R*-Pt** as a red crystal.

(*R*)-[Pt(II)(BINOL)(bpy)] (***R*-Pt**). ¹H-NMR (500 MHz, *d*₆-DMSO): δ 9.36(2H, d), 8.52(2H, d), 8.39(2H, t), 7.89(2H, t), 7.77(2H, d), 7.69(2H, d), 7.40(2H, d), 7.15(2H, t), 7.04(2H, t), 6.79(2H, d). ¹³C-NMR (500 MHz, *d*₆-DMSO): 163.05, 157.15, 147.72, 140.09, 135.43, 128.67, 128.21, 127.92, 127.68, 125.65, 125.05, 125.00, 124.24, 123.54, 121.59. MS(MALDI-TOF): *m/z* 635.2 (M⁺). Anal. calcd for C₃₀H₂₀N₂O₂Pt: C 56.69, H 3.17, N 4.41. Found: C 56.56, H 3.18, N 4.36.

(*S*)-[Pt(II)(BINOL)(bpy)] (***S*-Pt**). ¹H-NMR (500 MHz, *d*₆-DMSO): δ 9.36(2H, d), 8.52(2H, d), 8.39(2H, t), 7.89(2H, t), 7.77(2H, d), 7.69(2H, d), 7.40(2H, d), 7.15(2H, t), 7.04(2H, t), 6.79(2H, d). ¹³C-NMR (500 MHz, *d*₆-DMSO): 163.05, 157.14, 147.71, 140.08, 135.43, 128.68, 128.21, 127.92, 127.68, 125.65, 125.05, 125.01, 124.24, 123.54, 121.59. MS(MALDI-TOF): *m/z* 635.2 (M⁺). Anal. calcd for C₃₀H₂₀N₂O₂Pt: C 56.69, H 3.17, N 4.41. Found: C 56.56, H 3.16, N 4.40.
