S1. General methods

Powder X-ray diffraction (PXRD) patterns were collected on a Rigaku ULTIMA IV diffractometer equipped with Cu K α in a 2θ range of 5–40°. FT-IR spectra were recorded on a Nicolet NEXUS 670 spectrophotometer using KBr pellets in the range of 500–4000 cm⁻¹. Elemental analyses (C, H and N) were performed on an Elementar Vario ELIII analyzer. Inductively coupled plasma (ICP) experiment was conducted with a ThermoFisher ICAP7200HS emission spectrometer. TG analyses were carried out on a Mettler Toledo TGA/SDTA851 instrument under flowing N₂ or air atmosphere with a heating rate of 5°C min⁻¹. UV-visible absorption spectra were measured on a SHIMADZU UV-1800 spectrophotometer. Fluorescence spectra were recorded at room temperature with an Edinburgh FLS980 fluorescence spectrophotometer. The zeta potential was performed by JS94H microiontophoresis apparatus.

S2. X-ray Crystallography.

Diffraction intensity data for **1** was collected on a Bruker Apex II CCD area detector equipped with graphite-monochromated Mo-K α radiation ($\lambda = 0.71073 \text{ \AA}$) at 293K. Empirical absorption correction was applied using the SADABS program. The structure was solved by direct methods and refined by the full-matrix least-squares based on F² using SHELXTL. The non-hydrogen atoms were refined anisotropically, and the hydrogen atoms of the ligands were placed in calculated positions and refined using a riding model. Notably, the solvent molecules are highly disordered and could not be modeled correctly, so the residual electron densities resulting from them were removed by Solvent Mask in Olex2. A solvent mask was calculated and 2424 electrons were found in a volume of 17477Å³ in 1 void per unit cell. This is consistent with the presence of 1 [C₂H₈N]⁺, 6[C₂H₉NO] and 24[H₂O] per Formula Unit which account for 2412 electrons per unit cell.

S3. Explanation for the Alert A and B in the CheckCIF reports

🚨 Alert level B

PLAT241_ALERT_2_B High 'MainMol' Ueq as Compared to Neighbors of O1
Check

Explanation: This alert comes from the large amount of disorder in the structure and the poor quality of the crystal data.

Table S1. Crystal data and structural refinements for **1**.

Complex	CP-1
Formula	Zn ₇ C ₁₁₆ H ₁₆₃ O ₇₆ N ₇ S ₆
Fw	3521.65
Crystal system	trigonal
Space group	$R\bar{3}c$
<i>a</i> (Å)	20.7129(8)
<i>b</i> (Å)	20.7129(8)
<i>c</i> (Å)	77.627(3)
α	90
β	90
γ	120
<i>V</i> (Å ³)	28842.1(18)
<i>Z</i>	6
ρ_{calc} (g m ⁻³)	1.178
μ (mm ⁻¹)	2.224
<i>F</i> (000)	10616.064
reflections collected	104521
unique reflections	6539
<i>R</i> _{int}	0.0768
<i>GOF</i>	1.0035
<i>R</i> ₁ [<i>I</i> > 2σ(<i>I</i>)]	0.0862
<i>wR</i> ₂ (all data)	0.3089

*The refinement results were obtained from Olex2 using Solvent Mask.

Figure S1. ¹H-NMR (DMSO-d₆, 500 MHz) spectrum of H₂L. δ: 4.13 (s, 3H, -OCH₃), 7.87 (1H), 7.93 (1H), 8.2-8.5 (3H).

Figure S2. [Zn₇(μ₃-OH)₃(COO)₆] SBU of UoC-1 (a and b); [Mn₈(μ₄-O)₃(COO)₁₂] SBU of Mn-1 (c).

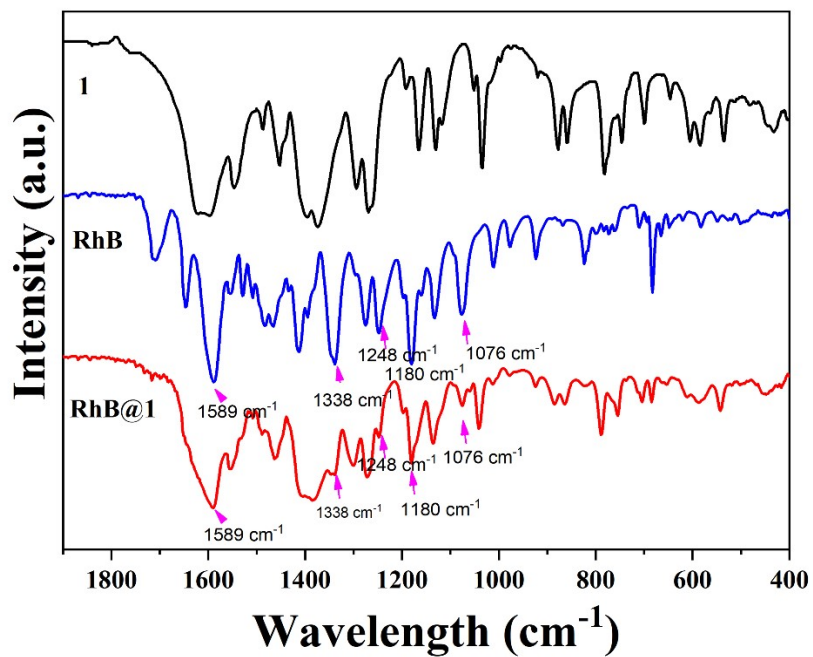

Figure S11. IR spectra of 1, dyes and dye@1.

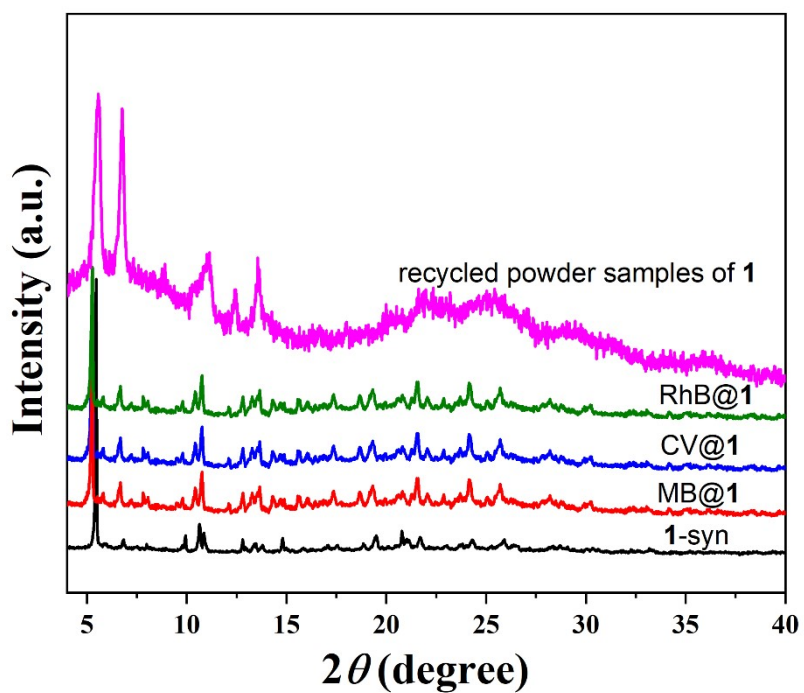

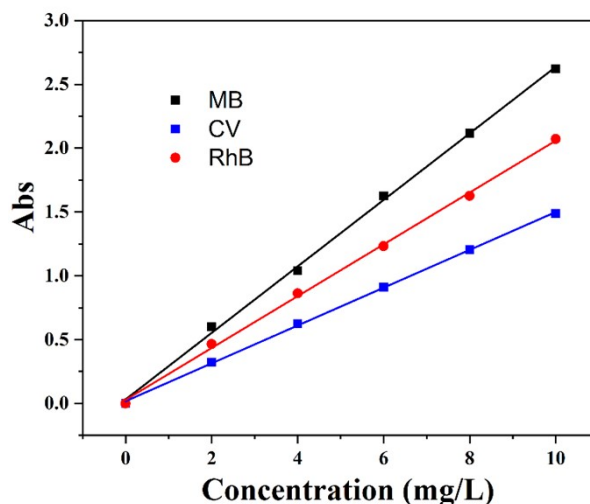

Figure S12. XRD patterns of crystal samples of 1 before and after dye adsorption.

dyes	Fitting linear equations	R ² (%)
MB	y = 0.2605 x + 0.03124	99.85
CV	y = 0.1482 x + 0.01771	99.94
RhB	y = 0.203 x + 0.028	99.85

Figure S13. The absorbed intensity (dots) of MB, CV and RhB at different concentrations (mg/L). The solid lines are the best linear fit.

Table S1. Equations for adsorption amounts and dye removal rate

Introduction	Equations	Comment
Adsorption amounts	$Q_t = \frac{(C_0 - C_t)V}{m}$	Where m (g) presents the weight of the adsorbent; C_0 (mg·L ⁻¹) is the initial dye concentration and C_t (mg·L ⁻¹) is the dye concentration at time t ; V (L) denotes the volume of dye solution.
Dye removal rate (η , %)	$\eta = \frac{C_0 - C_t}{C_0} \times 100\%$	

Table S2. Adsorption kinetics model.

Introduction	Kinetic model	Comment
Pseudo first-order kinetics model	$\ln(Q_e - Q_t) = \ln Q_e - k_1 t$	Where Q_t and Q_e (mg·g ⁻¹) are the adsorption capacity at time t and equilibrium; and k_1 (min ⁻¹) is the pseudo-first-order rate constant.
Pseudo second-order kinetics model	$\frac{t}{Q_t} = \frac{1}{k_2 Q_e^2} + \frac{t}{Q_e}$	Where k_2 (g·mg ⁻¹ ·min ⁻¹) is the pseudo-second-order rate constant.

Figure S14. Plots of pseudo-first-order kinetics for the adsorption of MB, CV and RhB on 1 (Experiment Conditions: $T = 25^\circ\text{C}$, $V = 10\text{ mL}$, $C_0 = 10\text{ mg}\cdot\text{L}^{-1}$, $m = 10\text{ mg}$)

Figure S15. Adsorption isotherms of MB, CV and RhB on 1 at room temperature.

Table S3. Adsorption isotherm model

Introduction	Isotherm model	Comment
Langmuir isotherm	$\frac{C_e}{Q_e} = \frac{C_e}{Q_{max}} + \frac{1}{K_L q_{max}}$	Where C_e (mg L^{-1}) is the equilibrium concentration of adsorbate; Q_e and Q_m (mg L^{-1}) represent the equilibrium adsorption capacity and maximum adsorption capacity, respectively; K_L (mg L^{-1}) named the Langmuir constant;
Freundlich isotherm	$\ln Q_e = \ln K_F + \frac{1}{n}(\ln C_e)$	Where K_F is the Freundlich constant related to the adsorption capacity; n is the adsorption strength constant under the Freundlich model.
