## Experimental Section

**Preparation of  $\text{CoO}_x/\text{C-D}$ ,  $\text{CoO}_x/\text{C-C}$  catalysts.** The preparation of the precursor was similar to the description in the article. Specifically,  $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  was replaced by  $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ , and a total of 0.004 mol  $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (1.16 g) was dissolved in the deionized water. And the subsequent process (the cold plasma and calcination methods) was same with the previous work. The catalysts were designed as  $\text{CoO}_x/\text{C-D}$  and  $\text{CoO}_x/\text{C-C}$ , respectively.

**Information about the cold plasma method.** Dielectric barrier discharge plasma was used in our cold plasma method. The plasma power was from Corona. lab (CTR-2000K). Before processing the samples in the reactor, made sure to put the same mass of precursor in the reactor (200 mg), which was sufficiently grinding. DBD plasma method was a gentle treatment, and the temperature in the reactor was displayed by an infrared camera, which was below 50 °C (Fig. S3).

**Fig. S1** TGA curves of  $\text{Co}_x\text{Fe}_y\text{O}_4/\text{C-D}$  and  $\text{Co}_x\text{Fe}_y\text{O}_4/\text{C-C}$ .
