Table S1. Fitting parameters of ThT fluorescence kinetics at 37 °C, under shaking conditions (250 rpm).

Peptide	hIAPP	VY21
T _{half}	8.45 ± 1.07 min	50.85 ± 1.77 min
t _{lag}	Not determined	18.4 ± 1.6 min

Table S2. Fitting parameters of ThT fluorescence kinetics at 25 °C, under shaking conditions (250rpm).

Peptide	hIAPP	VY21
T _{half}	31.73 ± 2.14 min	109.72 ± 18.94 min
t _{lag}	8.41 ± 2.10 min	61.78 ± 18.54 min

Table S3. Fitting parameters of time-resolve fluorescence lifetime magic angle (54.7°) decay of 20 μM ThT with 80 μM hIAPP at 25 °C, under non-shaking condition.

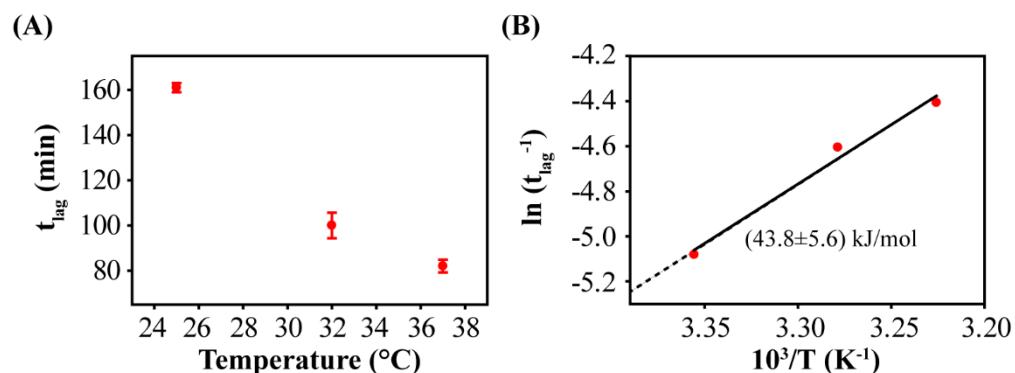

Figure S1. (A) Aggregation lag time (t_{lag}) of hIAPP under non-shaking conditions plotted as a function of aggregation reaction temperature. (B) Arrhenius plot of initial elongation rate vs. inverse temperature for 80 μ M hIAPP samples. The activation energy calculated from the well fitted ($R = 0.99$) data was 43.8 ± 5.6 kJ/mol.

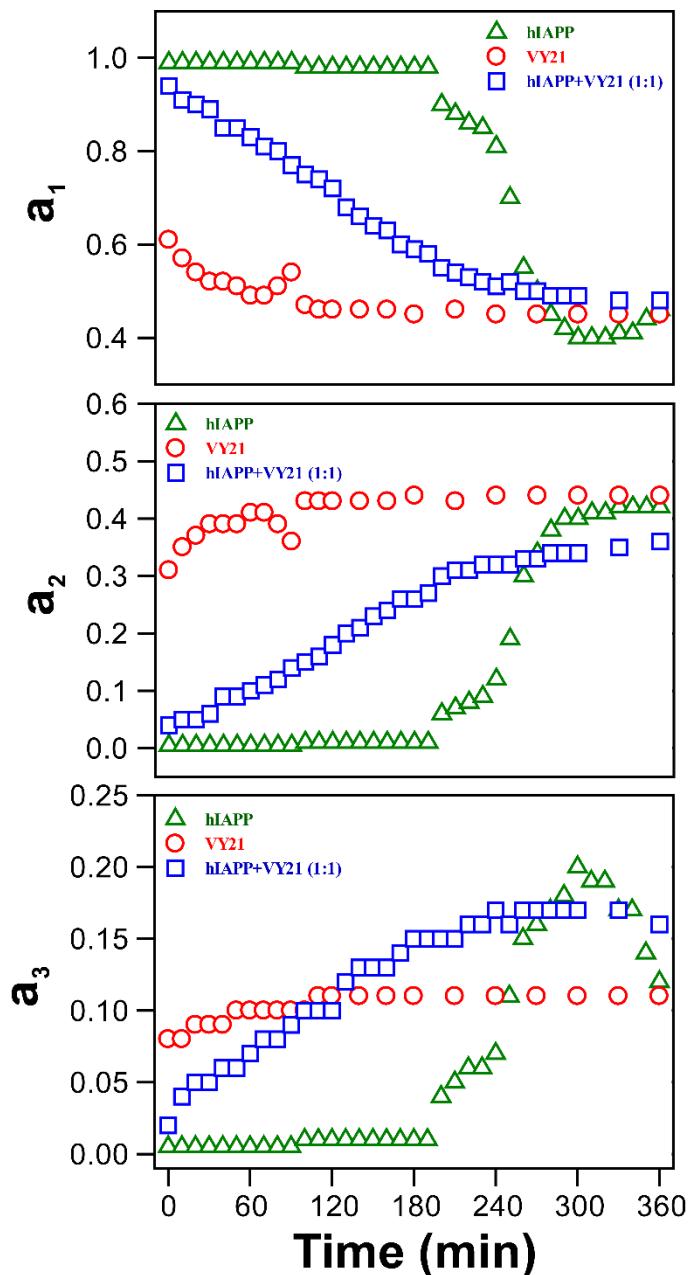

Figure S2. Stoichiometry of respective time scale in time-resolved fluorescence average lifetime of ThT with hIAPP, VY21, 1:1 mixture of hIAPP and VY21 (80 μ M) in phosphate buffer (20 μ M) solution up to 360 min at 25°C, under non-shaking conditions. All representations are color-coded.

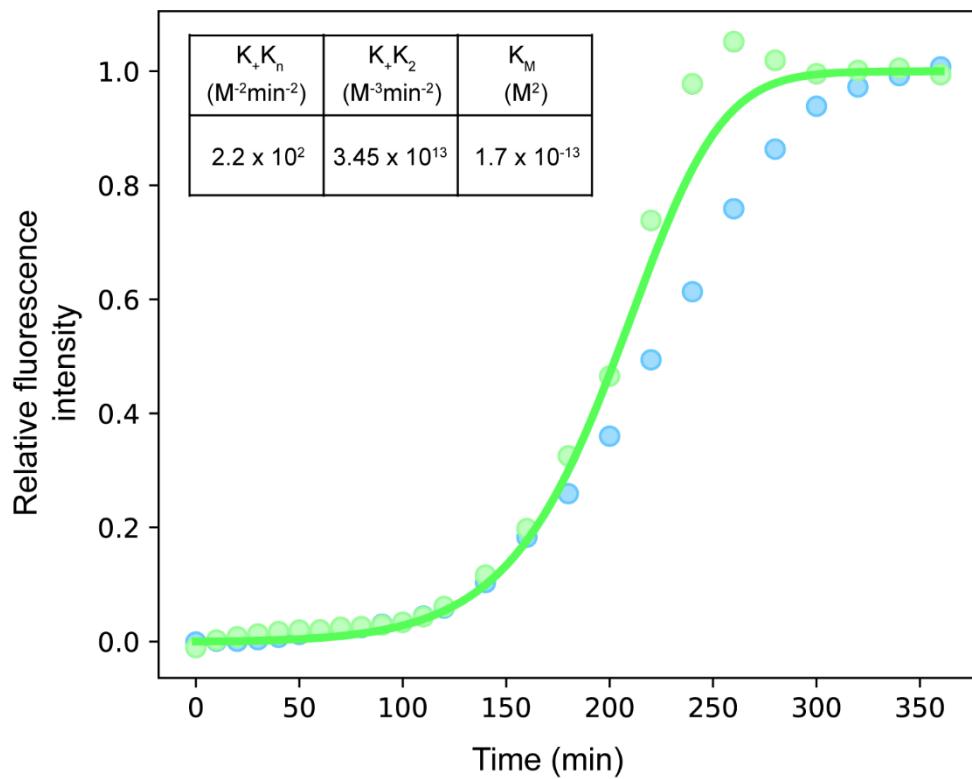

Figure S3. Fitting of ThT fluorescence curve of hIAPP at 25 °C under non-shaking conditions using the online platform Amylofit. Inset table shows the combined rate constant for secondary nucleation, $k_{+}k_2$, the combined rate constant for primary nucleation, $k_{+}k_n$, and the Michaelis constant, K_M , calculated from the fitting.

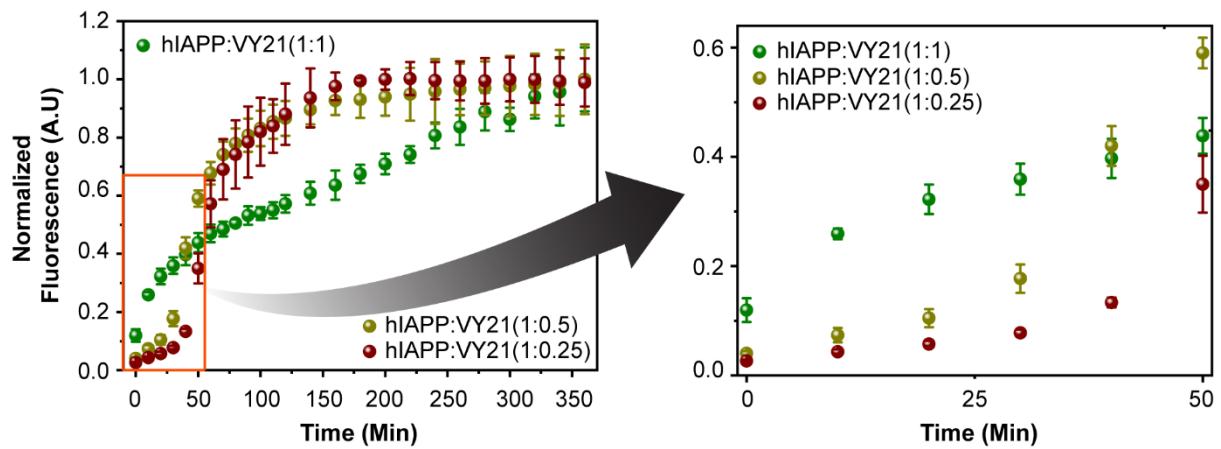

Figure S4. ThT fluorescence assay of hIAPP co-incubated with different ratios of VY21. Inset shows the aggregation kinetics of individual samples at the initial phase. With decreasing concentration of VY21, an increase in the lag-time was apparent.

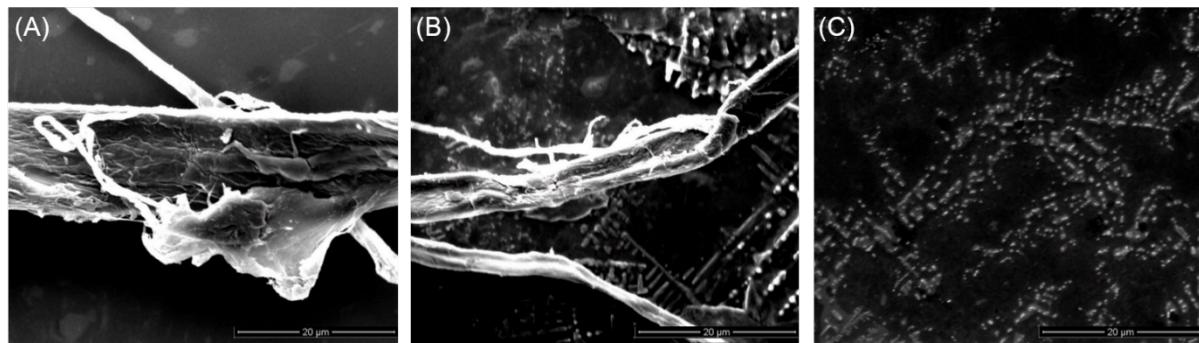

Figure S5. SEM images of (A) hIAPP, (B) hIAPP co-incubated with VY21 at a 1:1 molar ratio, and (C) VY21 aggregates at 25 °C, under non-shaking conditions.
