Figure S12: Plot of  $K_n$  versus cluster size for adsorption of argon at 87 K on macroporous alumina

Figure S13: Plot of  $K_n$  versus cluster size for adsorption of water at 303 K on macroporous silica.

Figure S14: Plot of  $K_n$  versus cluster size for adsorption of neo-pentane at 273 K on macroporous silica.

Figure S15: Plot of  $K_n$  versus cluster size for adsorption of n-pentane at 298 K on macroporous silica. For the 1-dimensional case  $K$  is arbitrarily set to 0.968.

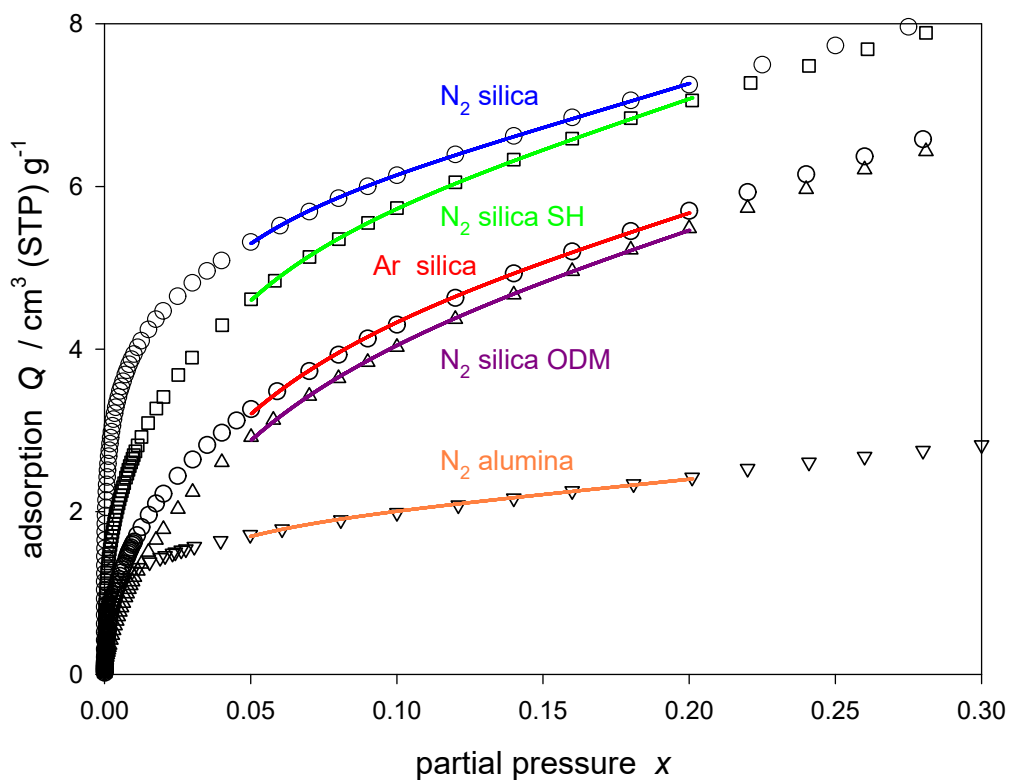

Figure S16: Monolayer detection by BET ( $0.05 < x < 0.2$ ).  $Q_{\text{BET}}$  in  $\text{cm}^3 \text{g}^{-1}$ :  
 $\text{N}_2$  silica:  $6.064 \pm 0.009$ , Ar silica:  $6.147 \pm 0.012$ ,  $\text{N}_2$  silica SH:  $6.147 \pm 0.012$ ,  $\text{N}_2$  silica ODM:  
 $5.200 \pm 0.023$ ,  $\text{N}_2$  alumina:  $2.022 \pm 0.011$

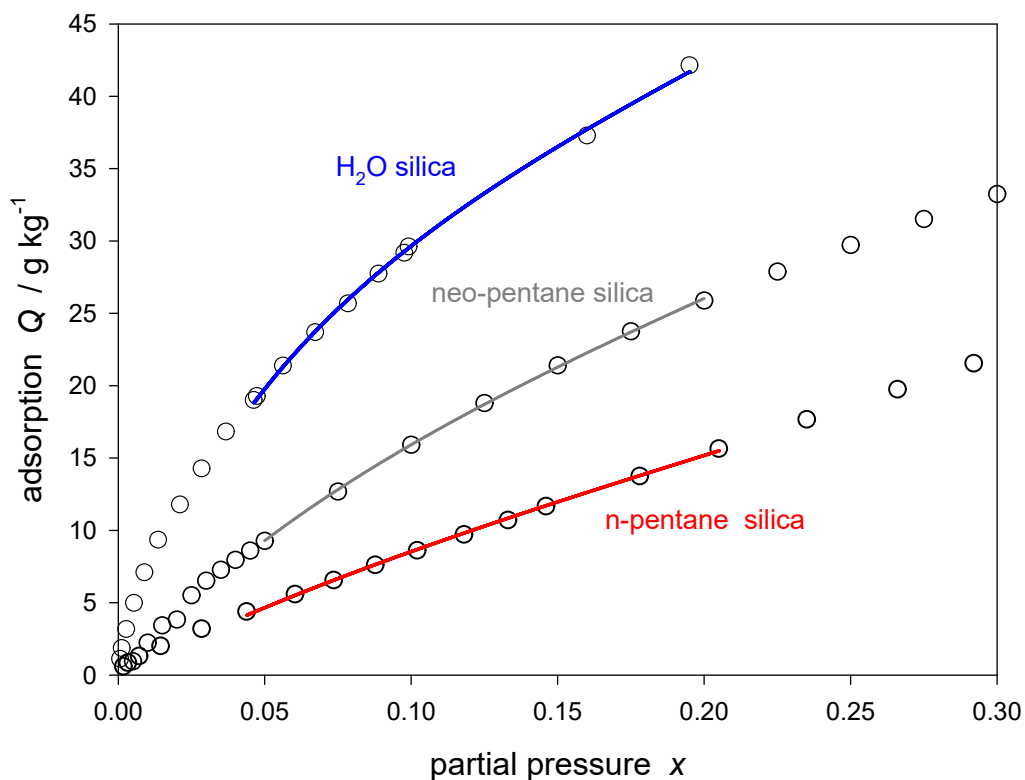

Figure S17: Monolayer detection by BET ( $0.05 < x < 0.2$ ).  $Q_{\text{BET}}$  in  $\text{g kg}^{-1}$ :  
 water silica:  $11.8 \pm 0.1$ , neo-pentane silica:  $32.7 \pm 0.4$ , n-pentane silica:  $22.7 \pm 0.5$

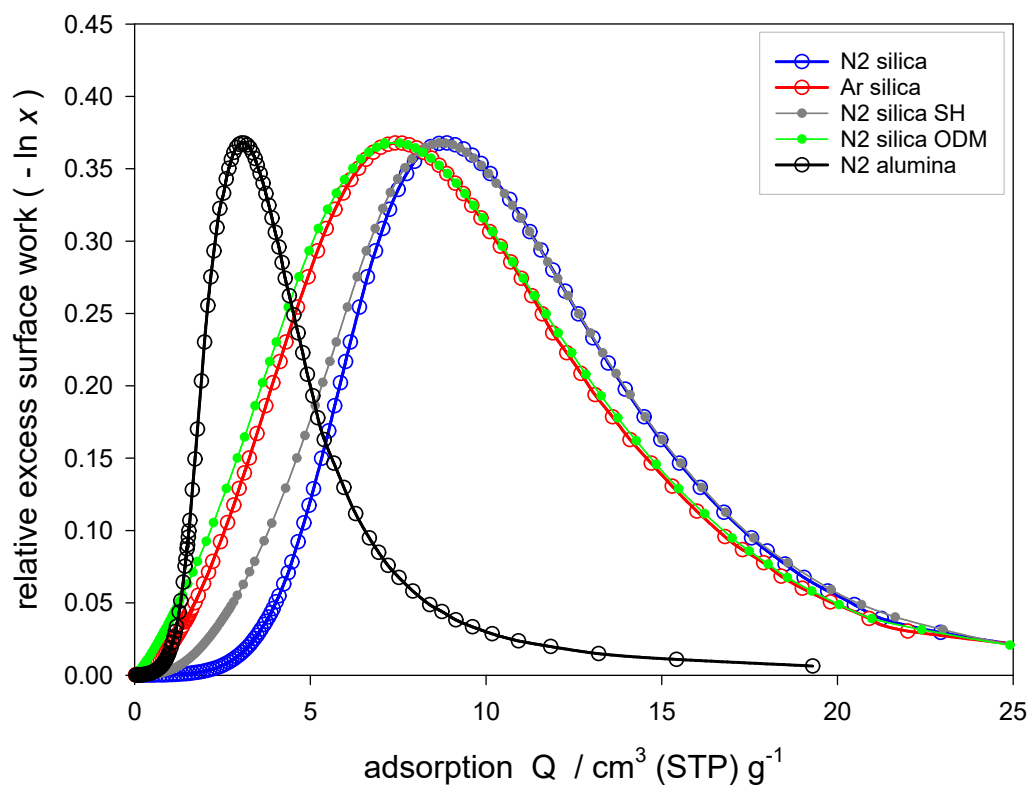

Figure S18: Monolayer detection by excess surface work (ESW).  $Q_{ESW}$  in  $\text{cm}^3 \text{g}^{-1}$ :  
 $\text{N}_2$  silica:  $8.944 \pm 0.007$ , Ar silica:  $7.5872 \pm 0.0008$ ,  $\text{N}_2$  silica SH:  $8.832 \pm 0.005$ ,  $\text{N}_2$  silica ODM:  
 $7.532 \pm 0.006$ ,  $\text{N}_2$  alumina:  $3.114 \pm 0.004$

Figure S19: Monolayer detection by excess surface work (ESW).  $Q_{BET}$  in  $\text{g kg}^{-1}$ :  
 water silica:  $18.5 \pm 0.1$ , neo-pentane silica:  $38.77 \pm 0.06$ , n-pentane silica:  $27.7 \pm 0.2$

## Program in R for nonlinear regression with the 2-dimensional general cluster sorption isotherm, version for type II isotherms

In addition to the programs in R for the 1-dimensional GCSI to be found in the supporting information of ref. [13], the program for the 2-dimensional GCSI is appended in the present SI. It yields the results  $E_1 = \ln K_1, K, a, b, Q_1$ , and  $\beta$ . For data input an excel file due to the following example has to be used:

rel pressure	adsorbed	estimated	parameters
5.55E-07	0.109	K1	150000
1.23E-06	0.210	K	0.95
2.38E-06	0.310	a	-0.18
4.18E-06	0.420	b	-0.055
6.74E-06	0.520	Q1	0.65
1.02E-05	0.620		
1.49E-05	0.730		
2.10E-05	0.830		
ect.	ect.		

Note: compared to the equations in the article the sign of  $a$  and  $b$  is inverted! Estimated start parameters are the starting values for non-linear regression. It is indicated within the running program if the limits of the parameters are reached. In that case the limits and perhaps some steps in the program have to be changed. The series of expansion (theoretically up to infinite) is terminated at  $\beta = 1000$ .

The program appends the results into the input file as new excel sheets concerning the calculated isotherm, calculated values of  $K_n$  and  $C_n$  ( $1 \leq n \leq 1000$ ), and the optimized parameters including the correlation coefficient  $R$ , the value of the corrected Akaike information criterion  $AICc$  [13] and the calculated monolayer adsorption in the dimension used for  $Q_1$  in the input file.
