The binding energy of CO_2 with the bare fulleride anion (ΔE^a) is also calculated using equation,

$$\Delta E^a = E_8 - (E_4 + E_7) \quad (\text{S1})$$

where E_8 , E_4 , and E_7 are the ZPE-corrected energy of the CO_2 complex of the bare fulleride, $(\text{C}_{60}(\text{CN})_n)^{n-}$, and 'n' CO_2 respectively. The Gibbs energy change (ΔG) is also calculated in a similar fashion.

Basis set superposition error (BSSE)

The correction for the basis set superposition error (BSSE) with the ionic complex formation is also calculated made by the counterpoise (CP) approach of Boys and Bernardi. In the case of $(IM^{n+}) \cdots ((C_{60}(CN)_n)^{n-})$, for $n = 1, 2, \text{ and } 3$ and but the BSSE calculation was not converging for the $n = 4, 5, \text{ and } 6$. Using the BSSE corrections of the systems $n = 1, 2, \text{ and } 3$ a linear correlation graph in the form $Y = (0.0027)*X + 0.0007$ was obtained with correlation coefficient $R = 0.9998$. by extrapolating which the approximate values for the BSSE corrections of the systems with $n = 4, 5, \text{ and } 6$ can be calculated. The BSSE was found to be $\sim 9\%$ of the E'_{rea} values.

In the present study, we have not evaluated all the different attacks of CN^- on the carbon cage. There are too many possibilities when the number of CN increases. The reported ionic complex of fullerene represents one of the many such possible isomeric structures. The energetics will only improve with the identification of the global minimum (it could be more exothermic than the reported value) as the energetics of the reported structures give ample evidence for the fulleride formation.

To understand the kinetic feasibility of this reaction, the transition state for the first addition of CN⁻ to C₆₀ is calculated in the presence of the solvent. The reaction intermediates involved in the formation (IM⁺)...((C₆₀(CN))⁻) ion-pair from the reaction of IMCN and C₆₀ were discussed in our previous publication [*Phys. Chem. Chem. Phys.*, 2021, **23**, 20086-20094]. Based on which we have studied the solvation (DCM) effects and the solvation effect incorporated relative energy data given in the Table show that the transition states is stabilized in solvent due to its high ionic character and in the solvent, the reaction is expected to be barrierless.
