### 1.1 The Nature of Transition States via Bond Order Analysis

The bond order analysis is based on changes in the degree of bonding and computing the percentages of bond forming (BF<sub>*i*</sub>) and bond cleaving (BC<sub>*j*</sub>) at a particular transition state of the reaction path (addition or decarboxylation). More specifically, the bond order analysis exposes the transition state's bond making and breaking processes in the chemical reactions. This could be mainly identified by calculating the average percentage of bond formation cleavage (BFC<sub>ave</sub>) in the TS geometries and their percentages are summarized in Table S4. Importantly, the computed BFC<sub>ave</sub> value indicates an early - “reactant-like” transition state if it ranges between 40-43%. On the other hand, BFC<sub>ave</sub> values > 60% denote the TS as a late - “product-like” transition state. In the case of the decarboxylation pathway, the rupturing of O–H bond length in <sup>D</sup>F1<sub>TS1</sub> was calculated to be around 1.243 Å, which is quite larger compared to the O–H bond length in <sup>D</sup>F1<sub>R</sub> (1.032 Å). At the same time, the N–H bond length was estimated to be shorter (1.113 Å) than the same in

${}^D F_{1TS1}$  transition state (1.272 Å for N–H). Also, the percentage of bond forming ( $B F_i$ ) (N–H) and bond cleaving ( $B C_j$ ) (O–H) indices were calculated to be 69.76% and 63.68% respectively. Therefore, the transition state  ${}^D F_{1TS1}$  is more of “product-like” which is endorsed by a  $B F C_{Ave}$  value (Table S4). The percentages of  $B F_i$ ,  $B C_j$  and  $B F C_{Ave}$  of the pertinent bonds in the transition state  ${}^D F_{TS2}$  are estimated and listed in Table S4. Again, this transition state for decarboxylation step was highly “product-like” and was endogenic (21.78 kcal/mol) with respect to the reactant  ${}^D F_R$ .

**Table S4.** Computed Wiberg Bond Formation ( $B F_i$ ), Bond Cleavage ( $B C_j$ ) Indices and Bond Formation Cleavage Average ( $B F C_{Ave}$ ) (in %) of all chosen transition states (TS) across both addition and decarboxylation pathways for both the catalysts F1 and F2.

Pathways	Transition States	$B F_i$ (%)	$B C_j$ (%)	$B F C_{Ave}$ (%)
<b>Catalyst (C<sub>60</sub>)-F1</b>				
Decarboxylation	${}^D F_{1TS1}$	69.76 (N-H)	63.68 (O-H)	66.72
	${}^D F_{1TS2}$	53.25 (O-H)	78.55 (N-H); 72.61 (C-C)	68.14
	${}^D F_{1TS3}$	33.53 (C-H)	59.05 (O-H)	46.29
Addition	${}^F F_{1TS1}$	62.15 (N-H)	40.94 (O-H)	51.54
	${}^F F_{1TS2}$	41.51 (C-C)	-	41.51
	${}^F F_{1TS3}$	29.88 (C-H)	95.35 (N-H)	62.62
	${}^F F_{1TS4}$	86.30 (O-H)	12.81 (O-H); 39.79 (C-C)	46.30
	${}^F F_{1TS5}$	35.74 (C-H)	50.08 (O-H)	42.92
<b>Catalyst(C<sub>60</sub>)-F2</b>				
Decarboxylation	${}^D F_{2TS1}$	58.69 (N-H)	72.23 (O-H)	65.46
	${}^D F_{2TS2}$	11.61 (O-H)	90.66 (N-H); 23.06 (C-C)	41.77
	${}^D F_{2TS3}$	39.63 (C-H)	57.65 (O-H)	48.64
Addition	${}^F F_{2TS1}$	75.37 (N-H)	43.65 (O-H)	59.51
	${}^F F_{2TS2}$	42.93 (C-C)	-	42.93
	${}^F F_{2TS3}$	39.62 (C-H)	83.21 (N-H)	61.42
	${}^F F_{2TS4}$	78.07 (O-H)	22.73 (O-H); 47.64 (C-C)	49.48
	${}^F F_{2TS5}$	35.32 (C-H)	50.21 (O-H)	42.76

Furthermore, a highly exoergic pathway was noticed for the final step of enol-to-keto formation/ the product ( ${}^D F_{1P}$ ). The bond forming (C–H; 1.536 Å) and breaking (O–H; 1.256 Å) were matured by 33.53% and 59.05% respectively, while the total  $B F C_{Ave}$  was computed to be

46.29%. This specifies the transition state  ${}^D\text{F1}_{\text{TS3}}$  (enol-to-keto) was “early” in category. From the estimated  $\text{BC}_j$ ,  $\text{BF}_i$  and  $\text{BFC}_{\text{Ave}}$  components in Table S1, the initial step was associated with the breaking of  $\alpha$ -hydrogen (C–H; 1.522 Å) and making of the N–H bond (N–H; 1.237 Å) in the transition state  ${}^A\text{F1}_{\text{TS1}}$  ( $\text{BFC}_{\text{Ave}}$ : 51.54%). This implied the “middle” nature of the transition state, falling neither into ‘product-like’ nor “reactant-like” categories. Besides, the other  $\text{BFC}_{\text{Ave}}$  values matured in the range between ~41 to 46% for  ${}^A\text{F1}_{\text{TS2}}$ ,  ${}^A\text{F1}_{\text{TS4}}$  and  ${}^A\text{F1}_{\text{TS5}}$ . Among the two pathways, the transition state  ${}^A\text{F}_{\text{TS3}}$  for the addition pathway could be described as “product-like” ( $\text{BFC}_{\text{Ave}}$  = 62.62%). Overall, except  ${}^A\text{F1}_{\text{TS3}}$ , all the transition states were “reactant-like” (early TSs), bringing out bond cleavage and bond forming percentages in the addition path. For catalyst F2,  ${}^D\text{F2}_{\text{TS2}}$  witnessed the C–C bond cleavage (23.06 %) to be faster ( $\text{BFC}_{\text{Ave}}$ : 41.77%) than  ${}^D\text{F1}_{\text{TS2}}$  ( $\text{BFC}_{\text{Ave}}$ : 68.14%), as collected in Table S1. In addition, for catalyst F2,  $\text{BFC}_{\text{Ave}}$  were estimated to be matured in the range 42–62% in all the five transition states which undoubtedly ascertains the fact that the key transition states are “early TS” in nature. This detailed analysis distinctly brought out the reaction coordinates and the feasibility of the reaction path, rendering it favourable for addition rather than the decarboxylation pathway.

## 1.2 Non-covalent Interaction (NCI) Analysis:

The NCI-RDG analysis was carried out on the optimized geometries of all intermediates and the corresponding transition states showing the stabilizing attractive (blue), destabilizing repulsive (red), and weak van der Waals (green) interactions. The RDG and their corresponding isosurfaces were calculated to identify the regions of non-covalent interactions and to analyze the strength of interactions between the substrates and the fullerene ( $\text{C}_{60}$ ) catalyst. Figure 7 displays the RDG scatter plots and their corresponding sign of  $(\lambda_2)\rho$  values. In Figure 7, anionic intermediates showed two interactions, the C=O--- $\pi$  surface and the anion- $\pi$  interactions with the corresponding interaction lengths computed to be 2.691 Å and 3.790 Å for  ${}^A\text{F1}_{\text{INT1}}$  and 2.710 Å and 3.761 Å for  ${}^A\text{F2}_{\text{INT1}}$ . At the same time,  ${}^D\text{F1}_{\text{INT1}}$  and  ${}^D\text{F2}_{\text{INT1}}$  showed only the C=O--- $\pi$  surface interaction with a distance of 2.715 Å and 2.641 Å, while the anion- $\pi$  interaction was absent. This finding agrees with the experimental report where López-Andarias and co-workers mentioned the  ${}^A\text{F}_{\text{INT1}}$  intermediates to exhibit anion- $\pi$  surface interactions in the addition pathway, whereas, the  ${}^D\text{F}_{\text{INT1}}$  intermediates do not show the same across the decarboxylation pathway. If this were not the case, then  ${}^A\text{F}_{\text{INT1}}$  intermediates would not be exoergic with respect to  ${}^D\text{F}_{\text{INT1}}$  (Figures 1 and 2),

and, would have contradicted the experimental observations. Figure 7 also shows the RDG isosurface maps of  ${}^D F_{INT1}$  and  ${}^A F_{INT1}$  with selected weak interactions such as the intramolecular hydrogen bond (attractive and shown in blue), destabilizing repulsive and weak van der Waals interactions. In NCI analysis, the non-covalent interactions have  $\lambda_2$  values ranging from large negative magnitudes to zero. On the other side, the positive  $\lambda_2$  values indicate the destabilizing repulsive interactions. In  ${}^A F_{INT1}$ , a strong attractive region exists between the anionic substrate and the fullerene catalyst, attributed to anion- $\pi$  interaction and is depicted as vdW interactions. More importantly, the existence of characteristic C=O--- $\pi$  interaction is seen to be prevalent on the catalyst surfaces.

Comparatively, the non-covalent interaction plots of intermediates  ${}^A F_{1INT1}$  and  ${}^A F_{2INT1}$  describe the presence of strong attractive interactions of intermolecular hydrogen bonding and vdW interactions. This attractive region is missing between anionic substrate and fullerene catalyst in  ${}^D F_{1INT1}$  and  ${}^D F_{2INT1}$  as shown in Figure 7. The above computational analysis thus estimated various non-covalent interactions of the type, N-H---O, O-H---O, C=O--- $\pi$  and C-O--- $\pi$  that stabilized the anionic intermediates. This investigation therefore concretely proves the significant role played by anion- $\pi$  interactions in stabilizing  ${}^A F_{INT1}$  intermediates, but not  ${}^D F_{INT1}$  intermediates, further supported by the earlier experimental observations.<sup>1</sup>

### 1.3 QTAIM Analysis:

Quantum theory of atoms in molecules (QTAIM) analysis was widely used to study the nature of chemical bonds, hydrogen bonds and various weak interactions present in the reactive species. It is well established that QTAIM analysis is predictable to understanding weak interactions in an anionic intermediate in addition reactions. In the present study, bonding and non-bonding interactions were analysed by assessing the topological properties that indicates the strength of the bond critical points (BCP's) and represents the nature of the bond. Various topological properties such as electron density ( $\rho(r)$ ), Laplacian of electron density ( $\nabla^2 \rho(r)$ ), Hessian values ( $\lambda_1, \lambda_2$ ), the potential energy density  $V(r)$  and kinetic energy density  $G(r)$  values have been calculated and listed in Table 1. As estimated, the molecular graph shows various types of interactions involving in both the anionic intermediates. The computed electron density at the BCPs for these interactions is well located within the hydrogen bond limits (0.002-0.035 a.u) and negative  $\nabla^2 \rho(r)$  values show these interactions are closed shell in nature.<sup>2,3</sup> It could be noted that

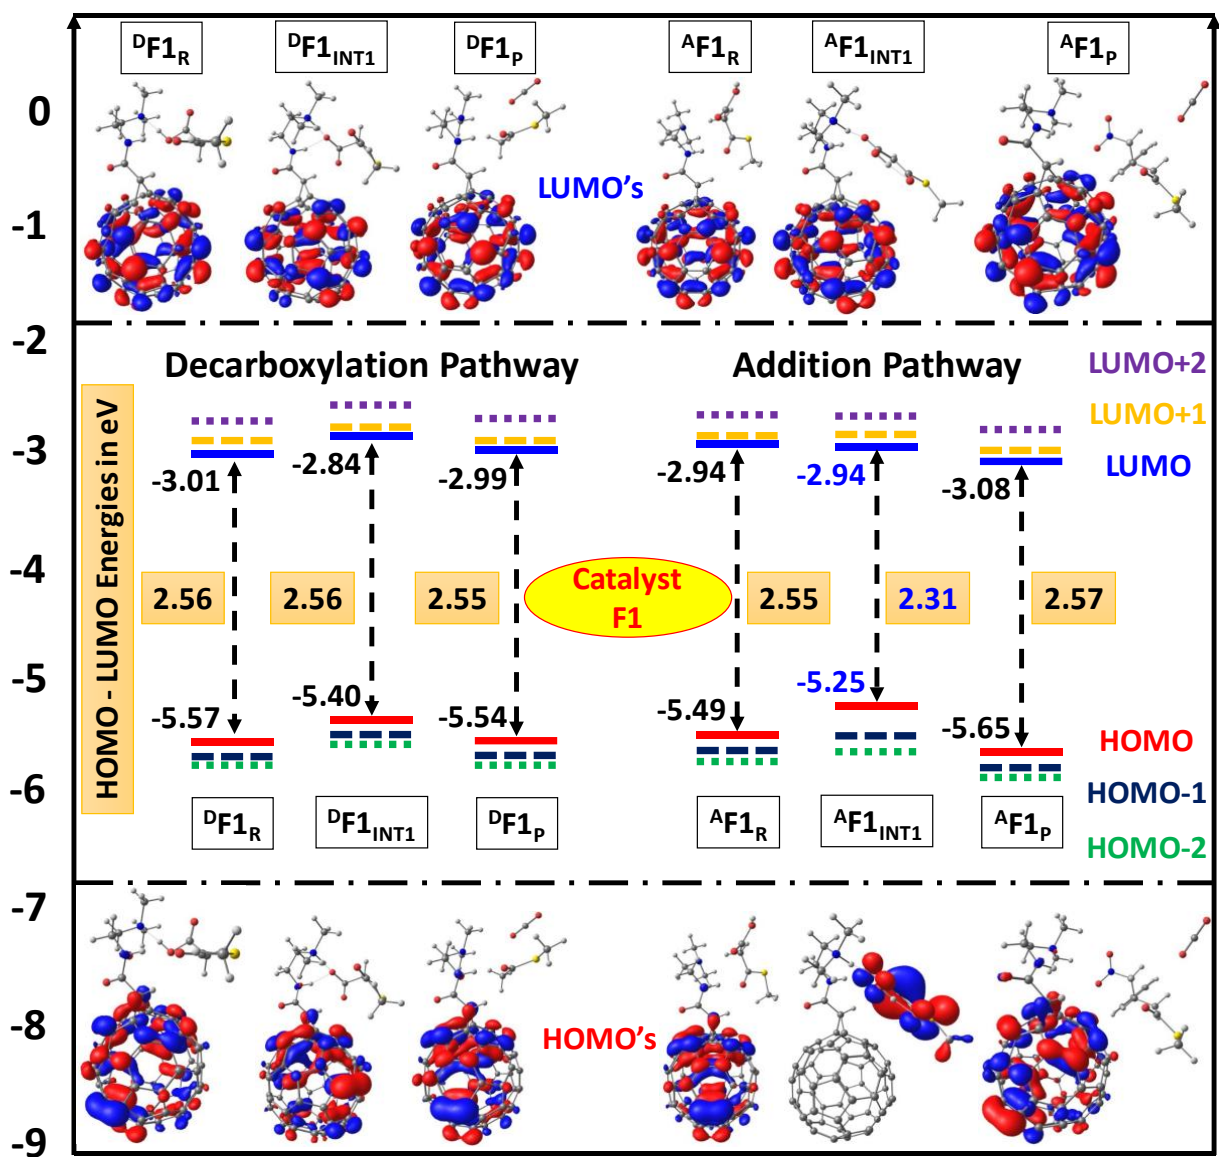

N-H<sub>3</sub>---O<sub>3</sub> (1.458 Å) has the higher electron density with 0.091 a.u (for <sup>A</sup>F1<sub>INT1</sub>) while others range from 0.002 to 0.02 a.u. A similar situation was detected for the <sup>A</sup>F2<sub>INT1</sub> intermediate (Figure 8) Furthermore, the calculated electron densities at BCPs of anion-π surface interactions were higher (0.0022 for H1---C1 and 0.0023 for S---C2) in <sup>A</sup>F2<sub>INT1</sub> and in <sup>A</sup>F1<sub>INT1</sub>, they were 0.0022 for H1---C1 and 0.0022 for S---C2, respectively. Furthermore, other important topological properties like |V|/G ratio values were calculated for both the <sup>A</sup>F1<sub>INT1</sub> and <sup>A</sup>F2<sub>INT1</sub> intermediates. It is profound to compute the covalency of all the discussed interactions. |V|/G ratio ~1 indicates the shared interactions are of closed shell type. The computed |V|/G ratio of strong intermolecular hydrogen bonding interactions of <sup>A</sup>F1<sub>INT1</sub> and <sup>A</sup>F2<sub>INT1</sub> were 1.514 and 1.422, implying stronger N-H---O interactions, vide Table 1. On other hand, for the anion-π stacking interactions in <sup>A</sup>F1<sub>INT1</sub> and <sup>A</sup>F2<sub>INT1</sub> the |V|/G ratio were estimated to be in the range 0.67 to 0.79. Additionally, the C=O---C<sub>60</sub> surface (intra-molecular) interactions involved in <sup>A</sup>F2<sub>INT1</sub> showed |V|/G ratio closer to ~0.80 when compared to <sup>A</sup>F2<sub>INT1</sub> intermediate (~0.80 a.u), revealing the importance and the strength of these interactions. Moreover, the <sup>A</sup>F1<sub>INT1</sub> shows two C=O---C<sub>60</sub> surface interactions (C=O<sub>4</sub>---C<sub>6</sub> and C=O<sub>4</sub>---C<sub>7</sub>), that are strong with electron densities ~0.008 a.u and |V|/G ratio ~0.8, which are quite comparable with other inter-molecular hydrogen bonding interactions. Overall, this study not only emphasized the importance of the intermolecular hydrogen bonding interactions, but also established two C=O---C<sub>60</sub> surface (C=O---C<sub>5(C60)}</sub> and C=O---C<sub>6(C60)}</sub>) and four anion---C<sub>60</sub> interactions (C-H---C<sub>1(C60)}</sub>, S---C<sub>2(C60)}</sub>, O<sub>1</sub>---C<sub>3(C60)}</sub> and C<sub>1</sub>---C<sub>4(C60)}</sub>) respectively, that helps in the stabilization of the anionic intermediates.

#### 1.4 Synergistic Frontier Molecular Orbital (FMO) Energy Levels:

Anion-π interactions relate to the LUMO level of the catalyst. Studies have shown the origin of intrinsic anion-π interactions associated with intrinsic pi-acidity to be synonymous with low LUMO levels. Accordingly, frontier molecular orbital (FMO) analysis for the ground state geometries of reactants, anionic intermediates and products was undertaken and the results are presented in Figure S5(a) and S5(b). For the selected reactive species across both the pathways, HOMO-LUMO energy gaps ranged between 2.27 to 2.57 eV. More specifically, <sup>A</sup>F1<sub>INT1</sub> and <sup>A</sup>F2<sub>INT1</sub> anionic intermediates possessed the smallest energy gaps of 2.31 eV and 2.27 eV respectively, suggesting them to be consistent with increasing electron sharing through anion-π interactions. Hence, stabilization of anionic intermediates could be facilitated by anion-π

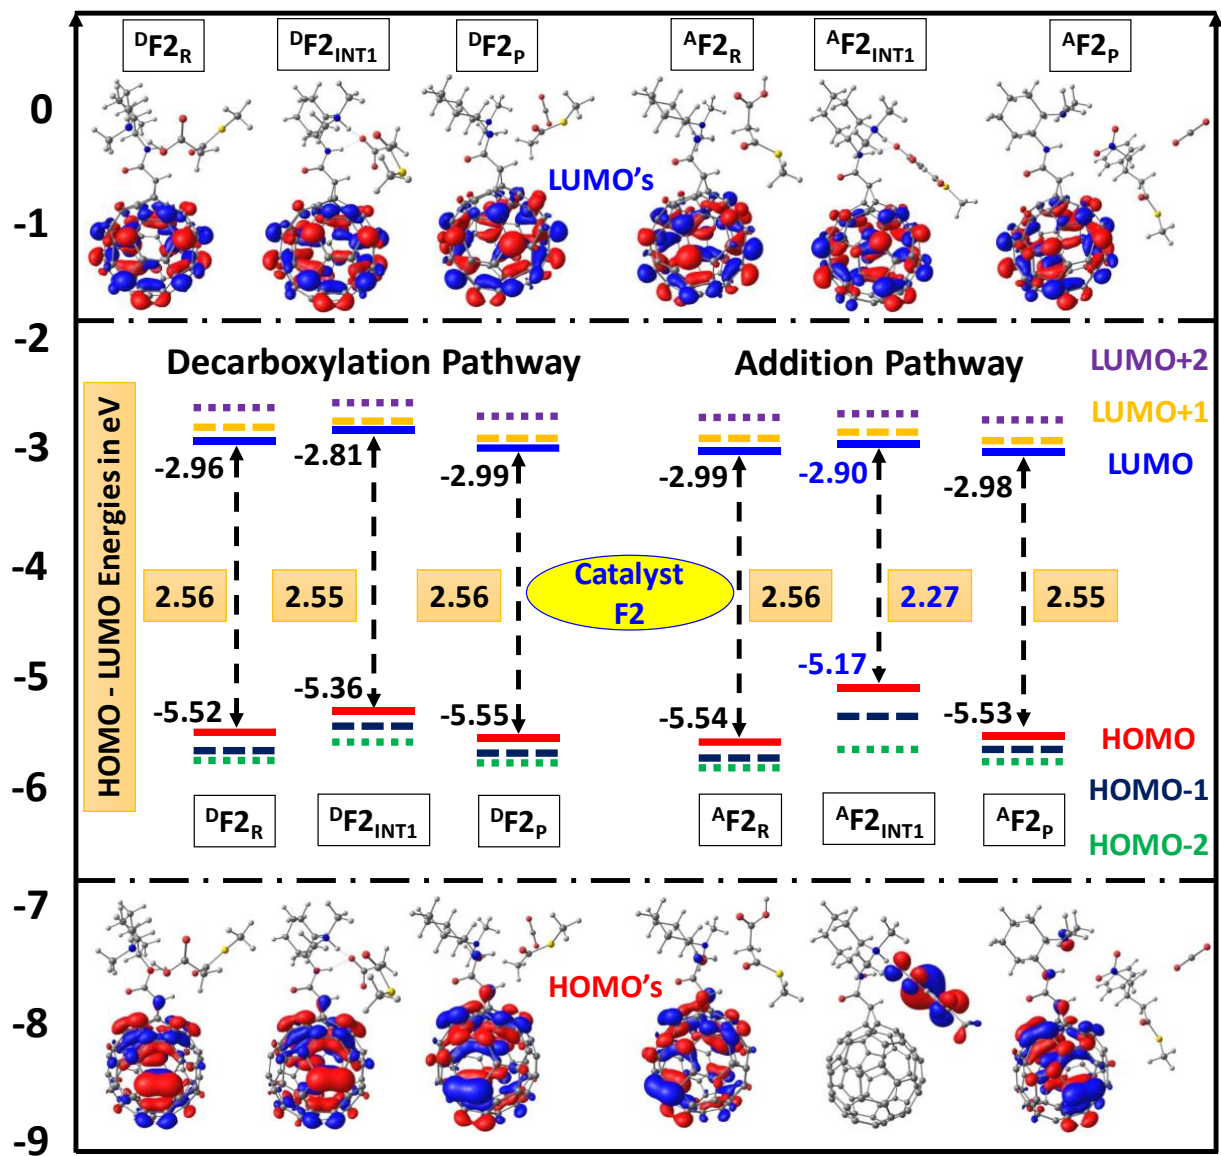

interactions on  $\pi$ - acidic surfaces and via electronic communication within this anion- $\pi$  stack, as reflected in the energy gaps. The small energy gap was caused by favorable electronic communication between the fullerene surfaces and anionic substrates in the stacks. On analyzing the corresponding FMOs, the HOMOs were associated with  $\pi$ -characters and LUMOs with  $\pi^*$  characters in fullerene catalysts.

**Figure S5(a).** The energy level diagram of frontier molecular orbitals of fullerene catalyst-F1 in the gas phase obtained at the B3LYP/6-31G(d) level of theory.

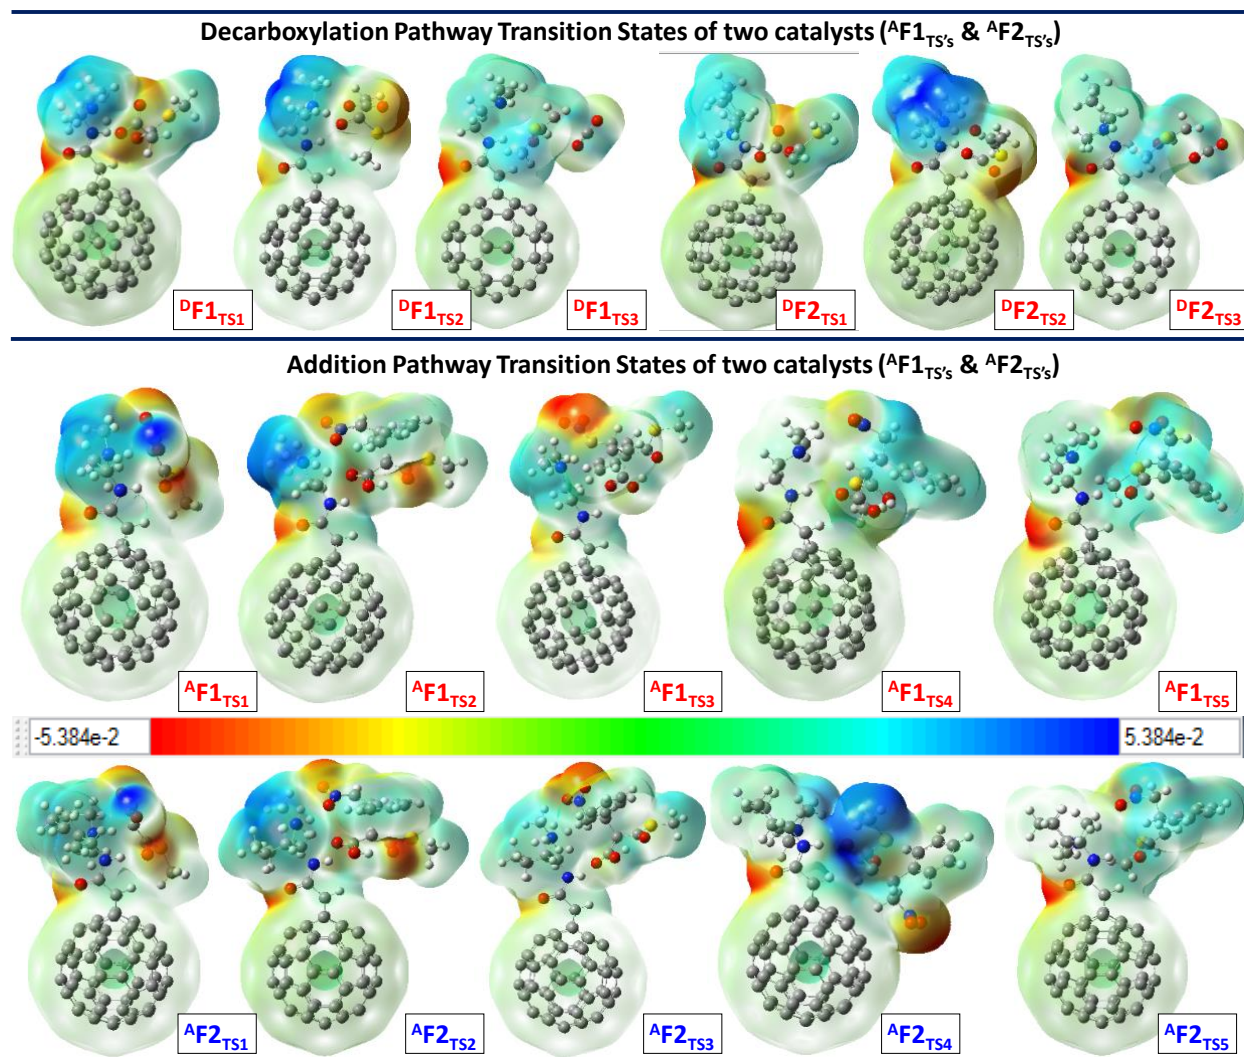

Especially, the HOMO's distribution of  ${}^A\text{F1}_{\text{INT1}}$  and  ${}^A\text{F2}_{\text{INT2}}$  intermediates are mainly localized within the anionic substrate species and LUMO's distributions only with fullerene systems. Moreover, the HOMO orbitals of  ${}^A\text{F1}_{\text{INT1}}$  and  ${}^A\text{F2}_{\text{INT1}}$  were computed to be highly stabilized with energies -5.25 eV and -5.17 eV while the other species were relatively less stabilized with energies ranging from -5.65 eV to -5.36 eV.

Analyzing the distribution pattern of HOMOs of reactants, intermediates and products (Figure S5(a) and S5(b)) it is revealed that the molecular orbitals were populated over the entire fullerene molecule with strong  $\pi$  character, while the LUMOs were also delocalized over the entire fullerene molecular skeleton with  $\pi^*$  character, except  ${}^A\text{F1}_{\text{INT1}}$  and  ${}^A\text{F2}_{\text{INT1}}$ . This also confirms the HOMO to LUMO electronic transitions to be of  $\pi \rightarrow \pi^*$  nature. On the other hand, the HOMOs of  ${}^A\text{F1}_{\text{INT1}}$  and  ${}^A\text{F2}_{\text{INT1}}$  were computed to be distributed mainly over the anionic substrates, resembling lone pairs of non-bonding orbitals of C=O and C-O<sup>-</sup> parts and the LUMOs were populated over the entire fullerene molecular geometry with  $\pi^*$  orbital nature, thus originating intramolecular charge transfer (ICT) type of interactions. Therefore, a considerable amount of electron density had been delocalized from anionic substrates to fullerene part indicating the prevalence of strong intramolecular charge transfer (ICT). As discussed in the FMO analysis, the HOMO to LUMO transition for the first set of two molecules ( ${}^A\text{F1}_{\text{INT1}}$  and  ${}^A\text{F2}_{\text{INT1}}$ ) were computed to be purely of ICT nature while all other species exhibited with  $\pi \rightarrow \pi^*$  transitions.

**Figure S5(b).** The energy level diagram of frontier molecular orbitals of fullerene catalyst-F2 in the gas phase obtained at the B3LYP/6-31G(d) level of theory.

## 1.5. Molecular Electrostatic Potential Mapping (MESP)

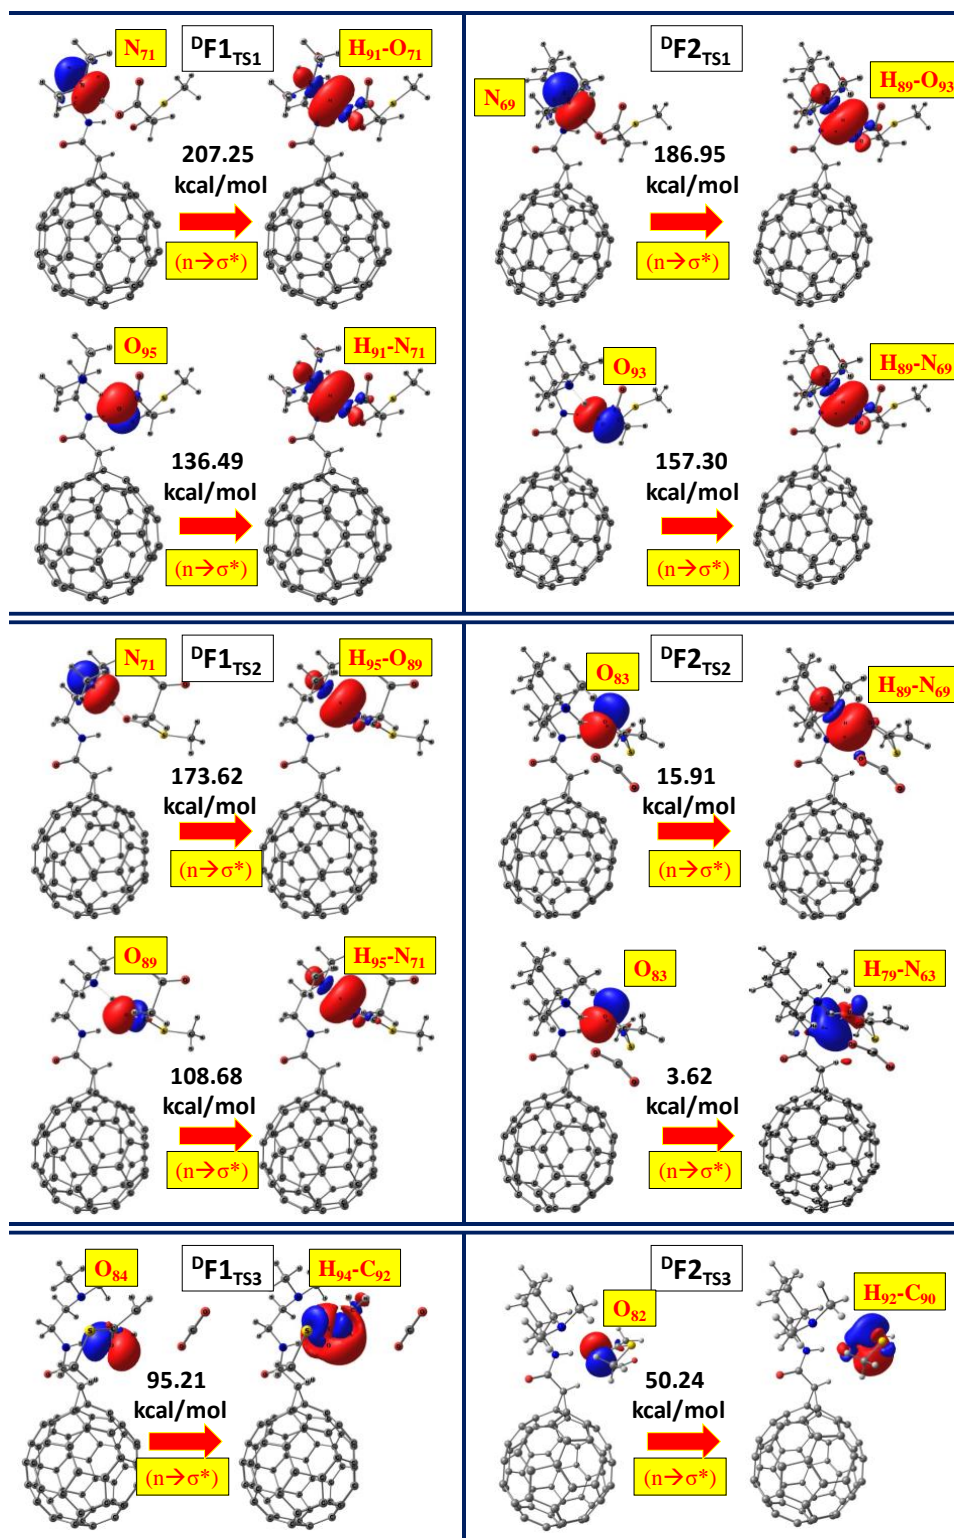

**Figure S6.** All transition states of MESP maps are depicted in decarboxylation and addition pathways.

## 1.6 Natural Bond Orbital (NBO) Analysis

The possible interactions associated with the transition states for both the pathways were estimated following NBO analysis, employed at the B3LYP/6-31G(d) level of theory, using the optimized geometries. Especially, the second-order perturbation interaction energies between the substituted fullerene C<sub>60</sub> catalyst and the substrate orbitals could play an extensive role in recognizing their reactivity. In view of this, the calculated second-order perturbation stabilization energy ( $E^2$ ) for the most prominent interactions in these transition states are collected in Table S5 & S3 and Figure S7(a) & S7(b). In Pathway-I (decarboxylation),  ${}^D F1_{TS1}$  is highly stabilized in the lone pairs of nitrogen (N<sub>71</sub> in fullerene) and oxygen (O<sub>95</sub>) atoms of substrate (MAHT) species. The orbital interactions arise due to highly stabilized by inter and intramolecular hydrogen bond interactions. The second-order stabilization energies, 207.25 kcal/mol for N<sub>71</sub> → H<sub>91</sub>-O<sub>95</sub> and 136.49 kcal/mol for O<sub>95</sub> → N<sub>71</sub>-H<sub>91</sub> in Figure S7(a) & S7(b) clearly indicate the prevailing  $n \rightarrow \sigma^*$  interactions as well as proton abstraction to take place from the substrate (MAHT) species to fullerene (C<sub>60</sub>) catalyst via the intermolecular hydrogen bonding interactions.

In  ${}^D F1_{TS2}$ , three orbital interactions were observed, where nitrogen atom of fullerene (C<sub>60</sub>) catalyst acted as donor NBO and the  $\sigma^*(O-H)$  of substrate acted as an acceptor NBO of which, only one interaction had a very strong stabilization energy of 173.62 kcal/mol. Two other interactions showed 108.68 kcal/mol for O<sub>89</sub> → N<sub>71</sub>-H<sub>95</sub> and 44.94 kcal/mol for O<sub>82</sub> → C<sub>83</sub>-O<sub>84</sub> respectively (Table S5 & S6). However, the transition state  ${}^D F1_{TS3}$  was associated with 95.21 kcal/mol stabilization energy from O<sub>84</sub> → C<sub>92</sub>-H<sub>94</sub> interaction and was the lowest perturbed stabilization energy. Consequently,  ${}^D F1_{TS1}$  and  ${}^D F1_{TS2}$  showed slight significant changes in the second-order stabilization energy, due to the influence of cyclic ring functionalized in catalyst F2. In the addition pathway, intermediates and transition states showed  $n \rightarrow \sigma^*$  interactions and their energy ranges were estimated as 50 to 217 kcal/mol, resulting from intermolecular hydrogen bonding interactions (See supporting information Table S5 and S6). On the other hand,  ${}^D F2_{TS1}$ ,  ${}^D F2_{TS2}$  and  ${}^D F2_{TS3}$  were associated with only  $n \rightarrow \sigma^*$  interactions stabilized by 186.95 kcal/mol (N<sub>69</sub> → H<sub>89</sub>-O<sub>93</sub>), 15.91 kcal/mol (O<sub>83</sub> → H<sub>89</sub>-N<sub>69</sub>) and 50.24 kcal/mol (O<sub>82</sub> → H<sub>92</sub>-C<sub>90</sub>), respectively, which could be the major reason for the higher reactivity of the transition states. Overall,  ${}^A F1_{TS4}$  showed relatively higher stabilization energy (by 372.86 kcal/mol) compared to all the other  $n \rightarrow \sigma^*$  interactions. The overall orbital interactions are shown in Figure S7(a) & S7(b). Overall, a good

correlation between the NBO stabilization energies ( $n-\sigma^*$ ) were visualized for all the transition states. It is interesting to observe the NBO analysis to help explain the higher reactivity of  ${}^A\text{F2}_R$ , stabilized by lower energies (2.36 kcal/mol and 4.68 kcal/mol) than all other reactant species of both the pathways (Table S6). To gain more insight into this stabilization, various interactions existing between fullerene ( $\text{C}_{60}$ ) and substrates need to be explained and examined. Overall, the presence of strong hydrogen bonding interactions gripped the key to the variance in the reactivity of the species.

**Figure S7(a).** Natural bond orbitals of strong hydrogen bonding interactions in the respective transition states involved in decarboxylation pathways. Second-order stabilization energies are given in kcal/ mol.

**Figure S7(b).** Natural bond orbitals of showing strong hydrogen bonding interactions in the respective transition states involved in addition pathway. Second-order stabilization energies are given in kcal/mol.

**Table. S5** Computed natural bond analysis (NBO) of all chosen for the transition states (TS's) at both addition and decarboxylation pathways in both the catalysts F1 and F2.

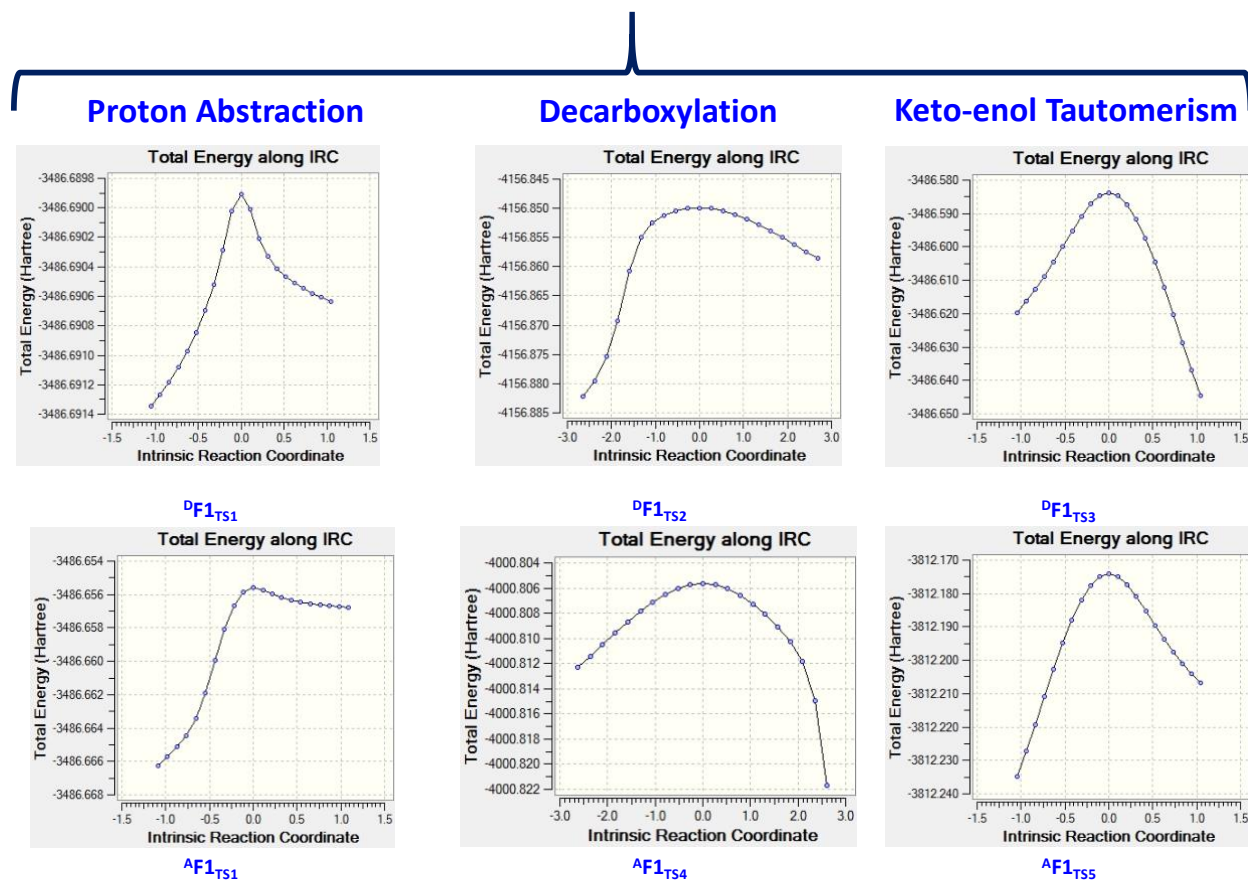

Pathways	Transition States (TS's)	Possible Interactions	Second-Order Stabilization Energy (E <sub>2</sub> ) in kcal/mol
<b>Catalyst-F1</b>			
Decarboxylation	<sup>D</sup> F1 <sub>TS1</sub>	N <sub>71</sub> → H <sub>91</sub>	207.25
		O <sub>95</sub> → N <sub>71</sub> -H <sub>91</sub>	136.49

**Table. S6** Computed natural bond analysis (NBO) of all chosen for the reactive species at both addition and decarboxylation pathways in both the catalysts F1 and F2.

Pathways	Intermediates	Possible Interactions	Second-Order Stabilization Energy ( $E_2$ ) in kcal/mol
<b>Catalyst-F1</b>			
Decarboxylation	${}^D\text{F1}_R$	$\text{N}_{71} \rightarrow \text{H}_{95}$	64.49
		$\text{O}_{82} \rightarrow \text{H}_{95}$	377.28
	${}^D\text{F1}_{\text{INT1}}$	$\text{N}_{71} \rightarrow \text{H}_{91}$	322.28
	${}^D\text{F1}_{\text{INT2}}$	$\text{N}_{71} \rightarrow \text{O}_{84}-\text{H}_{95}$	31.46
	${}^D\text{F1}_P$	$\text{N}_{71} \rightarrow \text{O}_{92}-\text{H}_{95}$	3.52
		$\text{O}_{84} \rightarrow \text{N}_{63}-\text{H}_{81}$	7.16
Addition	${}^A\text{F1}_R$	$\text{N}_{71} \rightarrow \text{C}_{82}-\text{H}_{95}$	5.80
	${}^A\text{F1}_{\text{INT1}}$	$\text{N}_{71} \rightarrow \text{H}_{90}$	296.46
		$\text{O}_{93} \rightarrow \text{H}_{90}$	121.38
	${}^A\text{F1}_{\text{INT2}}$	$\text{O}_{102} \rightarrow \text{H}_{91}$	87.49
		$\text{O}_{101} \rightarrow \text{N}_{63}-\text{H}_{81}$	14.61
	${}^D\text{F1}_{\text{INT3}}$	$\text{N}_{71} \rightarrow \text{H}_{93}$	93.47
<b>Catalyst-F2</b>			
Decarboxylation	${}^D\text{F2}_R$	$\text{N}_{69} \rightarrow \text{H}_{89}$	79.72
		$\text{O}_{93} \rightarrow \text{H}_{89}$	348.08
	${}^D\text{F2}_{\text{INT1}}$	$\text{N}_{69} \rightarrow \text{H}_{84}$	357.31
		$\text{O}_{83} \rightarrow \text{H}_{84}$	50.19
	${}^D\text{F2}_{\text{INT2}}$	$\text{N}_{69} \rightarrow \text{O}_{82}-\text{H}_{93}$	24.41
	${}^D\text{F2}_P$	$\text{N}_{69} \rightarrow \text{C}_{90}-\text{H}_{93}$	2.31
$\text{O}_{82} \rightarrow \text{N}_{63}-\text{H}_{79}$		6.79	
Addition	${}^A\text{F2}_R$	$\text{N}_{69} \rightarrow \text{C}_{80}-\text{H}_{93}$	2.36
		$\text{O}_{69} \rightarrow \text{N}_{63}-\text{H}_{79}$	4.68
	${}^A\text{F2}_{\text{INT1}}$	$\text{O}_{91} \rightarrow \text{N}_{63}-\text{H}_{79}$	5.03
		$\text{O}_{91} \rightarrow \text{H}_{88}$	91.44
		$\text{O}_{82} \rightarrow \text{O}_{90}-\text{H}_{88}$	30.51
	${}^A\text{F2}_{\text{INT2}}$	$\text{O}_{100} \rightarrow \text{H}_{89}$	44.87
$\text{O}_{99} \rightarrow \text{N}_{63}-\text{H}_{79}$		13.13	
${}^A\text{F2}_{\text{INT3}}$	$\text{N}_{69} \rightarrow \text{H}_{91}$	81.00	

## 1.7 IRC Analysis

### Catalyst-F1

**Figure S8.** Selected Intrinsic reaction coordinate (IRC) analysis involved at catalyst F1 in decarboxylation and addition pathways.

**Figure S9.** Energetic favorability (under thermodynamic vs kinetic controls) for the decarboxylation and addition pathways at B3LYP/6-31G(d)//ωB97X-D/6-311+G(d,p). The horizontal axis is a reaction coordinate, and the vertical axis represents Gibbs energy in kcal/mol.
