1. Materials and Instruction

All materials and reagents for the synthesis were commercially available and used without any further purification. FT-IR spectra were recorded in the range of 400–4000 cm⁻¹ using KBr pellets on an EQUINOX55 FT/IR spectrophotometer and samples were prepared as KBr pellets. Elemental analysis for C, H and N was carried out a Perkin-Elmer 2400 CHN elemental analyzer. Powder X-ray diffraction (PXRD) measurements were executed on a Rigaku RU200 diffractometer at 60 kV, 300 mA with Cu K α radiation as the radiation source ($\lambda = 1.5406 \text{ \AA}$) in the angular range $\theta = 5\text{--}50^\circ$ at 25 °C. Thermogravimetric analysis (TGA) was conducted on a NETZSCH TG 209 thermal analyzer in the atmosphere of nitrogen at a heating rate of 10 °C/min. The thermodynamic parameters were measured by a TA/Nano isothermal titration calorimeter. Magnetic measurements were performed in the temperature range 2 K - 300 K with an applied field of 1000 Oe, using a Quantum Design MPMS-XL-7 SQUID magnetometer on polycrystalline samples. The freshly prepared crystalline samples wrapped into a piece of parafilm and packed in a polyethylene bag was pelletized to avoid any field induced crystal reorientation. The diamagnetic corrections for compounds were estimated using Pascal's constants. Alternating current (ac) susceptibility experiments were performed using an oscillating ac field of 2.0 Oe at ac frequencies ranging from 1 to 1000 Hz. The magnetization was measured in the field range 0 - 7 T.

2. Thermogravimetric analysis

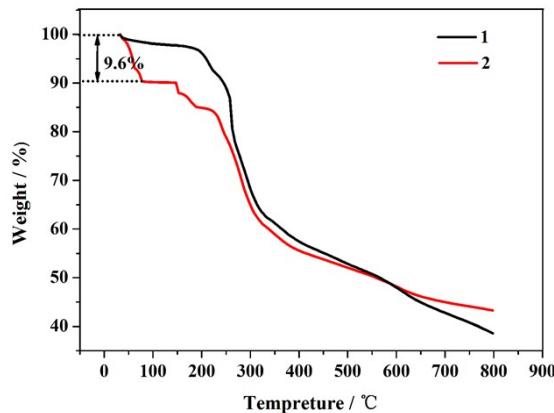

Figure S1. TGA of **1** and **2** under dry N₂ atmosphere.

3.X-Ray Powder Diffraction.

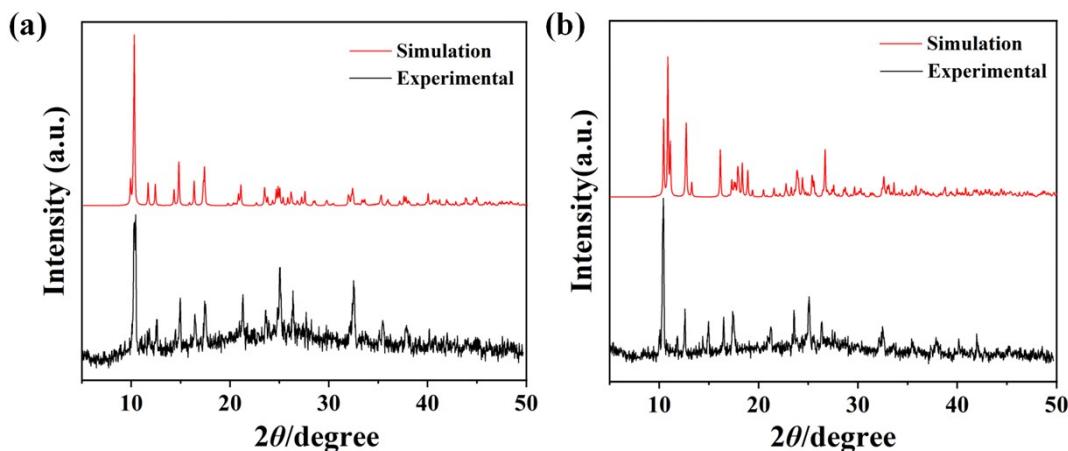

Figure S2. Experimental PXRD and calculated PXRD of **1(a)** and **2(b)**.

4.X-ray Crystallography.

The single crystal X-ray experiment was employed using Rigaku SCX mini CCD diffractometer equipped with Mo K α radiation($\lambda = 0.71073 \text{ \AA}$ radiation) and ω and φ scanning mode. The SAINT and the SADABS software were performed for absorption correction.[S5-S6] The structures of **1** and **2** were solved by the direct method and refined by full-matrix least-squares on F^2 using SHELXL-97 and SHELXL-2016 programs. [S7-S8] Anisotropic displacement parameters were employed for all non-hydrogen atoms. Hydrogen atoms were assigned to their calculated positions and subsequently allowed to ride on their parent atoms. CCDC-1553638 for **1** and CCDC-1553639 for **2** can be obtained via Cambridge Crystallographic Data clicking [www.ccdc.cam.ac.uk/ data_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif).
