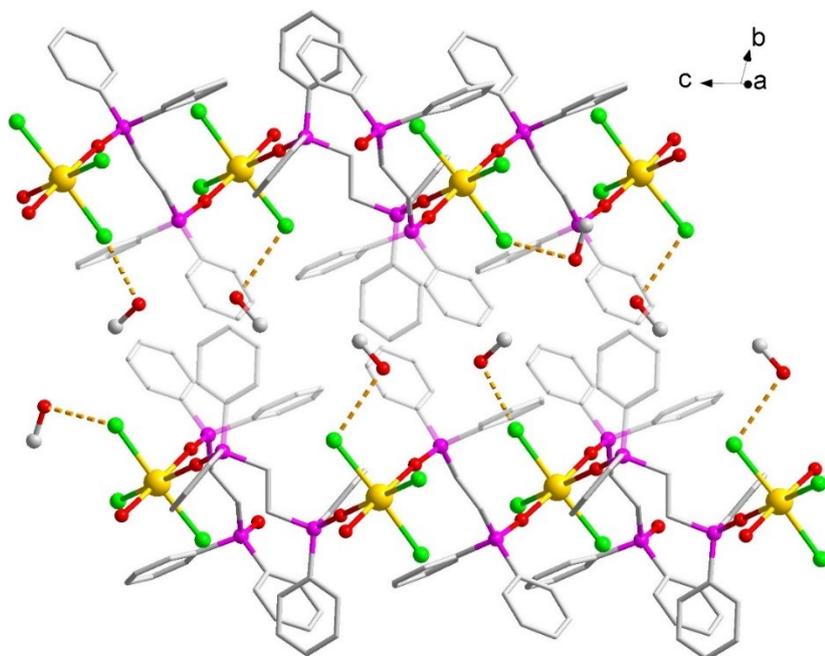

Figure S1. O-H...Cl hydrogen bonds in complex **1** among MeOH molecules and the 2D-layers.

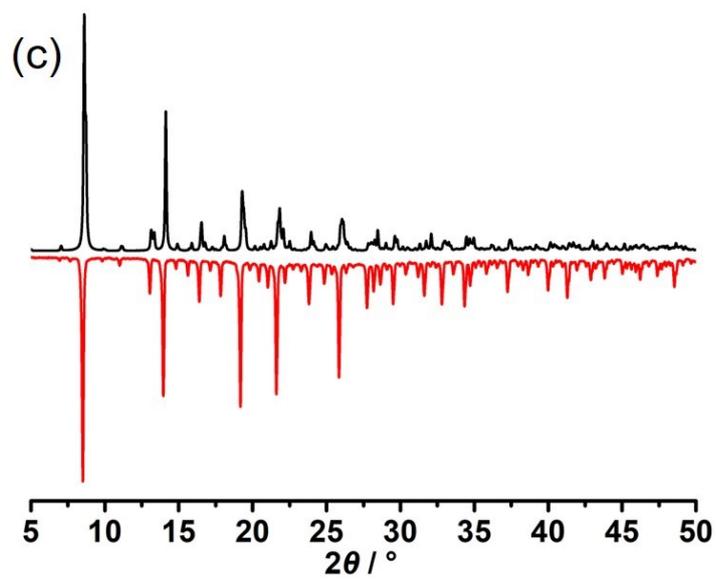

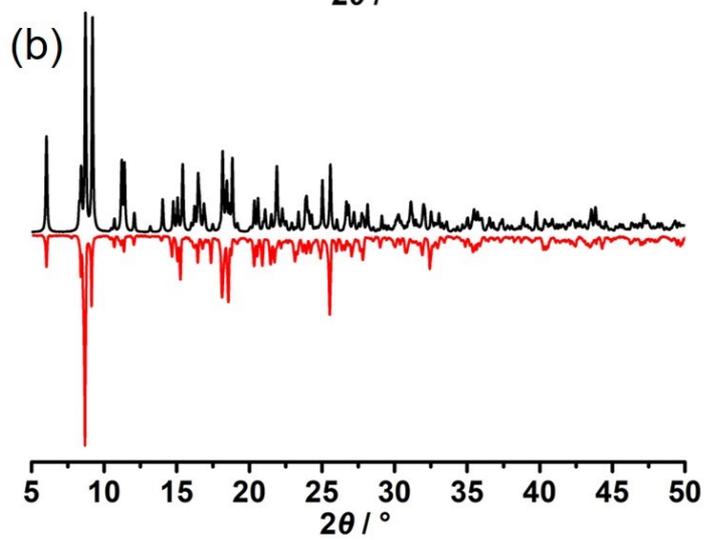

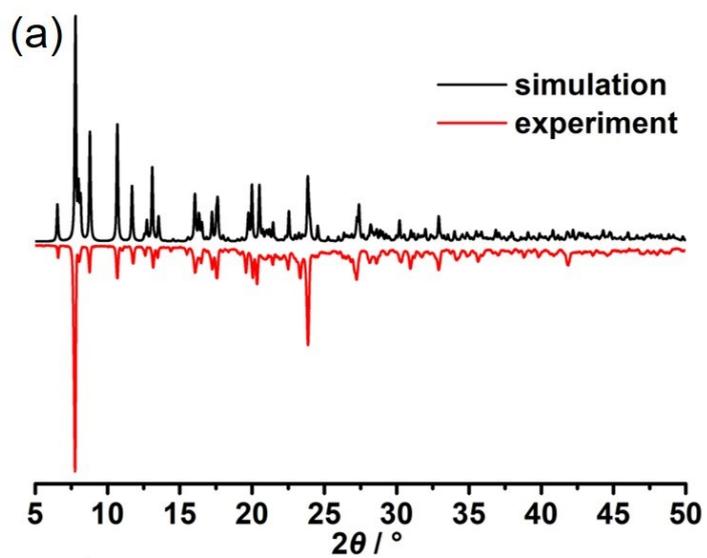

Figure S2. Experimental (red) and simulated (black) powder X-ray diffraction patterns of complexes **1(a)**, **2(b)** and **3(c)**.

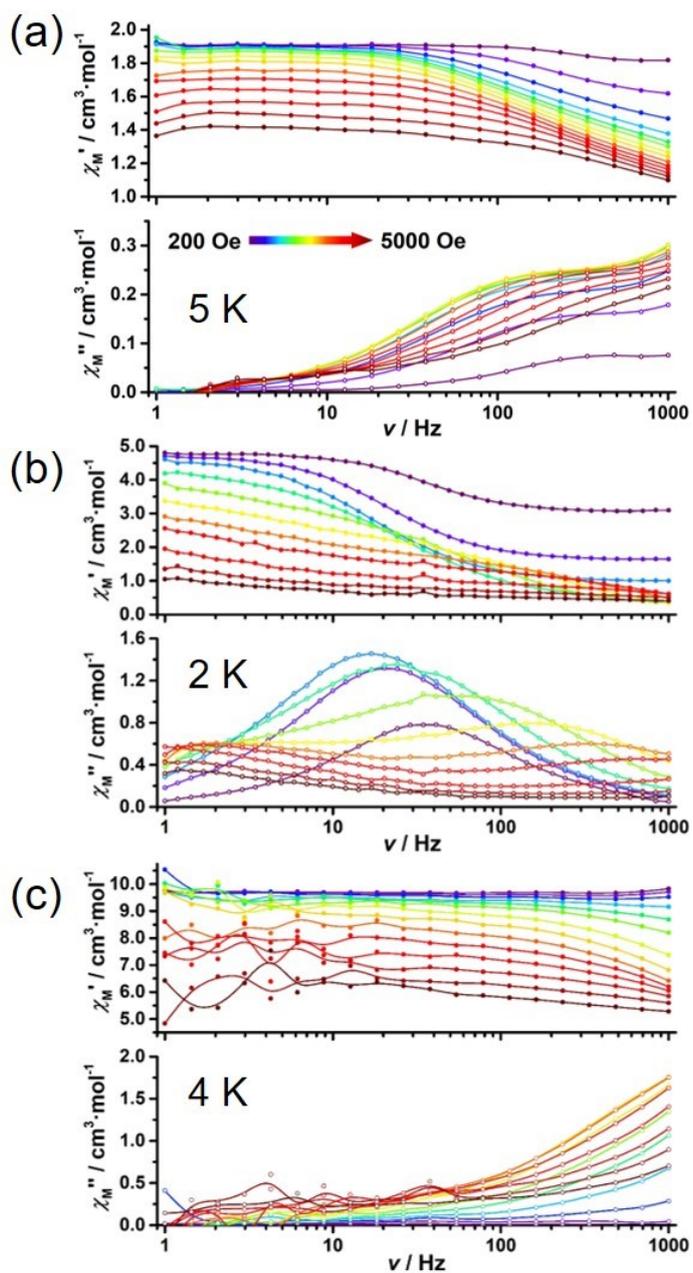

Figure S3. Frequency dependent in-phase (χ_M' , solid circles) and out-of-phase (χ_M'' , open circles) ac magnetic susceptibility for complex **1** (a), **2** (b) and **3** (c) under various dc fields at indicated temperatures. The chromatic solid lines represent the fitting results using generalized Debye model. The obtained optimal dc fields are 1600 Oe for **1**, 600 Oe for **2**, and 2000 Oe for **3**, respectively.

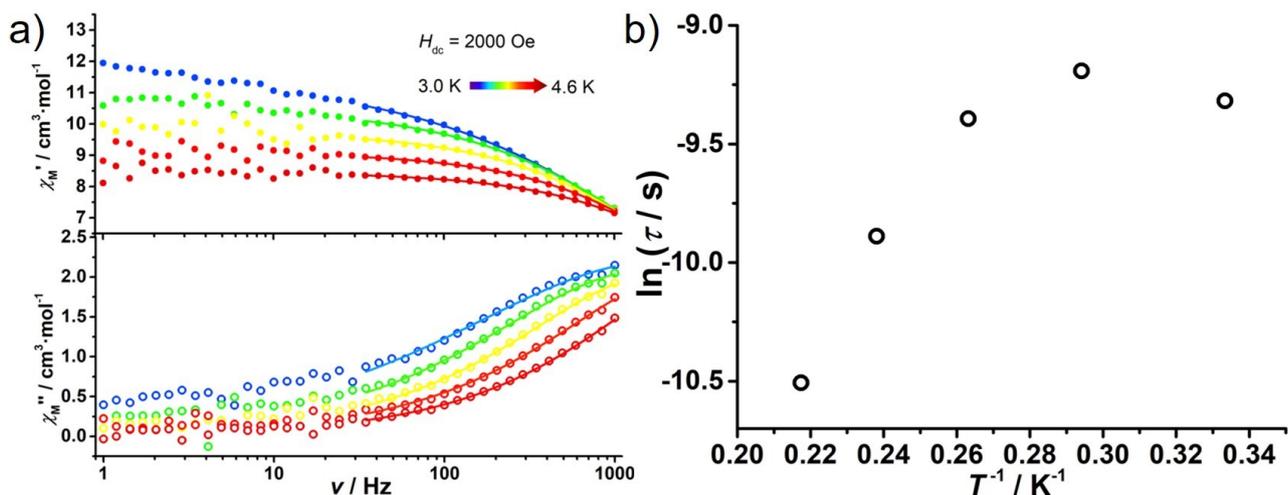

Figure S4. Frequency dependent in-phase (χ'_M , solid circles) and out-of-phase (χ''_M , open circles) ac magnetic susceptibility plots under a dc field of 2000 Oe, and temperature dependent relaxation time, for complex 3. The circles and lines represent the experimental data and the fitting results, respectively. Although no peak of χ''_M can be observed under an external 2 kOe dc field, the relaxation times was extracted by fitting high-frequency section by modified Debye model.

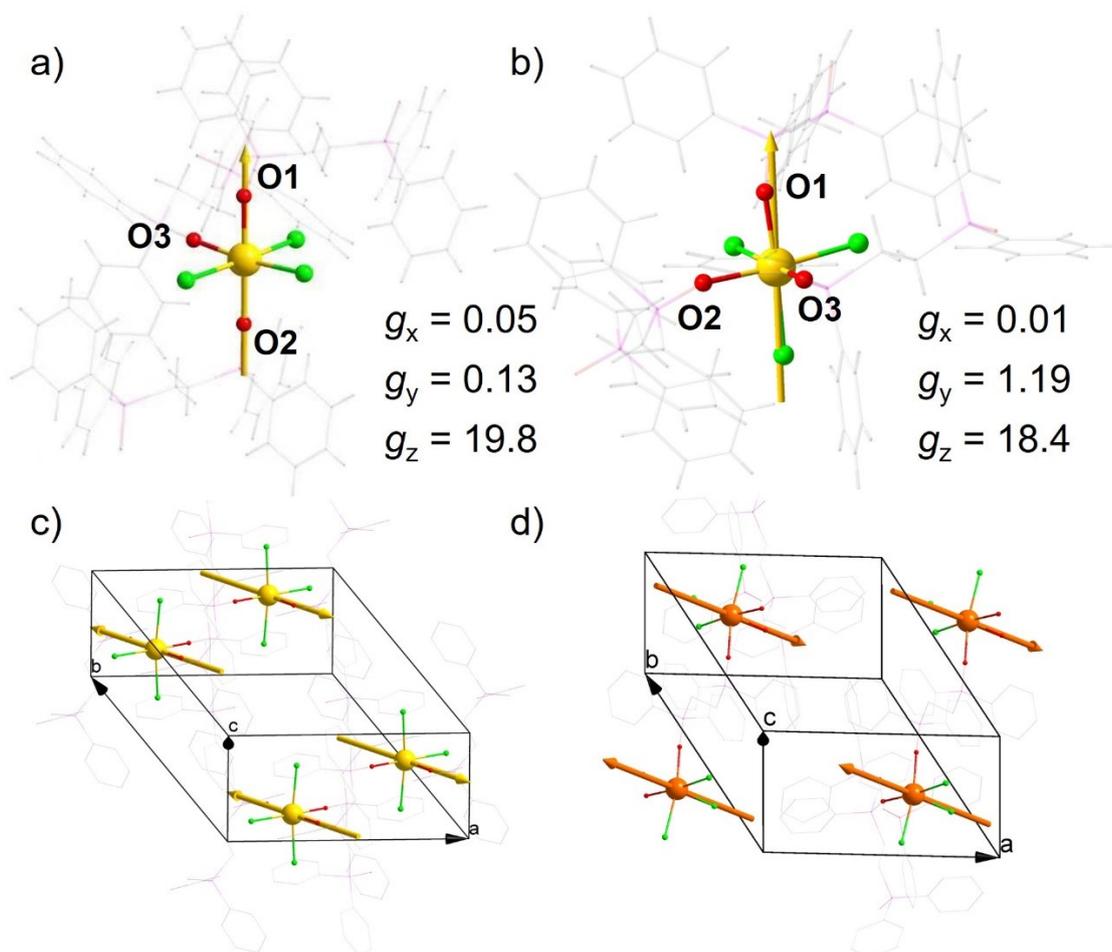

Figure S5. Orientation of the g_z -tensors of the ground state KDs for the Dy(III) ions in a single molecule (a for 1 and b for 2) and in one unit cell (c for 1 and d for 2). The ligands are transparentized for clarity. The orientation of

the g_z -tensors for the Dy(III) ions in one unit cell is centrosymmetric because the nature the $P-1$ space group.

Table S4. CASSCF computed spin-free state energies for complex **1** and **2**.

Spin-free State Energies (cm ⁻¹) for 1	Spin-free State Energies (cm ⁻¹) for 2
0	0
