# Electronic Supporting Information for: Organometallic Flow Chemistry: *Solvento* Complexes

Benjamin J. Frogley,<sup>a</sup> Anthony F. Hill, \*<sup>a</sup> Hideki Onagi<sup>a</sup> and Lachlan J. Watson<sup>a</sup>

# Experimental

## **General Considerations**

Infrared spectra were obtained using a PerkinElmer Spectrum One FT-IR spectrometer. The strengths of IR absorptions are denoted by the abbreviations vs (very strong), s (strong), m (medium), w (weak), sh (shoulder) and br (broad). NMR spectra were obtained on Varian 400 (<sup>1</sup>H at 399.8, <sup>13</sup>C at 100.5), Bruker Avance 400 (<sup>1</sup>H at 400.1 MHz, <sup>13</sup>C at 100.6 MHz,  $^{31}\text{P}$  at 162.0 MHz), Bruker Avance 600 (1H at 600.0 MHz,  $^{13}\text{C}$  at 150.9 MHz) or a Bruker Avance 700 (<sup>1</sup>H at 700.0 MHz, <sup>13</sup>C at 176.1 MHz) spectrometers at the temperatures indicated. Chemical shifts ( $\delta$ ) are reported in ppm with coupling constants given in Hz and are referenced to the solvent peak, or external references (85% H<sub>3</sub>PO<sub>4</sub> in H<sub>2</sub>O for <sup>31</sup>P). The multiplicities of NMR resonances are denoted by the abbreviations s (singlet), d (doublet), t (triplet), m (multiplet), br (broad) and combinations thereof for more highly coupled systems. Where applicable, the stated multiplicity refers to that of the primary resonance exclusive of <sup>183</sup>W satellites. In some cases, distinct peaks were observed in the <sup>1</sup>H and <sup>13</sup>C{<sup>1</sup>H} NMR spectra, but to the level of accuracy that is reportable (i.e. 2 decimal places for <sup>1</sup>H NMR, 1 decimal place for <sup>13</sup>C NMR) they are reported as having the same chemical shift. High-resolution electrospray ionisation mass spectrometry (ESI-MS) was performed by the ANU Research School of Chemistry mass spectrometry service with acetonitrile, dichloromethane or methanol as the matrix.

The data for each complex are consistent with those previously reported for each complex:  $[W(CO)_5(PPh_3)]$ ,<sup>1</sup>  $[Mo(CO)_5(PPh_3)]$ ,<sup>1</sup>  $[Cr(CO)_5(PPh_3)]$ ,<sup>1</sup>  $[Mn(Cp')(CO)_2(PPh_3)]^2$  and  $[Re(Cp^*)(CO)_2(PPh_3)]^3$ . Crude NMR spectra are provided along with the isolated products for context.

# **Computational Details**

Computational studies were performed by using the *SPARTAN20*<sup>®</sup> suite of programs.<sup>4</sup> Geometry optimisation (gas phase) for diatomics and metal complexes was performed at the DFT level of theory using the exchange functionals  $\omega$ B97X-D of Head-Gordon.<sup>5,6</sup> The Los Alamos effective core potential type basis set (LANL2D $\zeta$ ) of Hay and Wadt <sup>7-9</sup> was used for I, Mo and W while Pople 6-31G\* basis sets<sup>10</sup> were used for all other atoms. Frequency calculations were performed for all compounds to confirm that each optimized structure was a local minimum and also to identify vibrational modes of interest. Cartesian atomic coordinates are provided below.

## General synthetic strategy

Following the quenching of *solvento* complexes with PPh<sub>3</sub>, the solutions were worked with under atmospheric conditions. Mixtures were recrystallised from  $Et_2O$ /hexane or subjected to column chromatography for purification (neutral alumina, gradient elution with petroleum spirits (40-60 °C or 60-80 °C)/diethyl ether or petroleum spirits (40-60 °C/CH<sub>2</sub>Cl<sub>2</sub>).

## Data for known compounds

**[W(CO)<sub>5</sub>(PPh<sub>3</sub>)]:** IR (THF, cm<sup>-1</sup>): 2072 m, 1983 w, 1940 vs; v<sub>co</sub>. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, 298 K):  $\delta_{H}$  = 7.48 (m, 15 H, PPh<sub>3</sub>). <sup>31</sup>P{<sup>1</sup>H} NMR (162 MHz, CDCl<sub>3</sub>, 298 K):  $\delta_{P}$  = 20.85 (<sup>1</sup>J<sub>WP</sub> = 244 Hz). <sup>13</sup>C{<sup>1</sup>H} NMR (150 MHz, CDCl<sub>3</sub>, 298 K):  $\delta_{C}$  = 199.32 (d, <sup>2</sup>J<sub>PC</sub> = 7 Hz, <sup>1</sup>J<sub>WC</sub> = 72 Hz, trans-WCO), 197.40 (d, <sup>2</sup>J<sub>PC</sub> = 7 Hz, <sup>1</sup>J<sub>WC</sub> = 63 Hz, *cis*-WCO), 135.4 (d, <sup>1</sup>J<sub>PC</sub> = 41 Hz, *i*-PPh<sub>3</sub>), 133.1 (d, <sup>2</sup>J<sub>PC</sub> = 12 Hz, *o*-PPh<sub>3</sub>), 130.5 (d, <sup>4</sup>J<sub>PC</sub> = 2 Hz, *p*-PPh<sub>3</sub>), 128.8 (d, <sup>3</sup>J<sub>PC</sub> = 10 Hz, *m*-PPh<sub>3</sub>). No discernible fragments were observed in the ESI-MS (+ve ion) spectrum other than [PPh<sub>3</sub> + H]<sup>+</sup>.
