

**Differences in microbial diversity, composition and function during
V(V) release and reduction in nitrate-V(V) co-contaminated water by
under liquid carbon sources**

The following equations are used for the first-level dynamics calculation and the zero-level dynamics calculation¹.

Zero-order kinetic module:

$$C_t = C_0 - kt$$

First-order kinetic module:

$$C_t = C_0 e^{-kt}$$

where C_t and C_0 indicate the pollutants concentrations ($\text{mg N} \cdot \text{L}^{-1}$) in the t , and k is the kinetic constant.

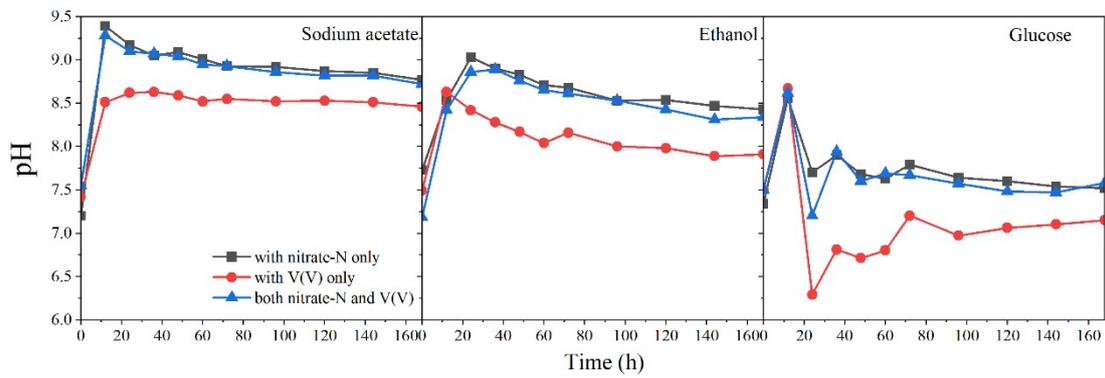

Fig. S7 Variation of pH in different liquid carbon source systems.

Table S1 The zero-order and first-order reaction kinetics of V(V) reduction by enzymes at different positions

Location	equation	k constant	R ²
CFS	$y = 0.0099x - 0.1187$	0.0099	0.9365
CFE	$y = 0.0059x - 0.1215$	0.0059	0.8477
CD	$y = 0.0187x + 0.6262$	0.0187	0.74

Table S2 the alpha-diverstiy index in V(V) release process (0) and V(V) reduction process (1)
